

Roto NT Designo Hardware

Convenient: 100° opening angle

Aesthetic design and functionality are important principles to consider when developing window technology. Roto NT Designo sets new standards in this field, having no visible hinges from outside and no cover caps that could come off.

The window can be opened up to a maximum angle of 100°. Roto NT Designo offers an especially generous opening width and with this, an unobstructed view for the customer.

Finest technology: All components are fully integrated in the window sash, making them invisible from the outside.

Strong: High sash weights and high security

With the standard Roto NT Designo hardware, sash weights of up to 176 lbs (80kg) are possible. As from May 2007, you can also make windows with a sash weight of up to 286 lbs (130kg).

Innovative security concept. Roto NT Designo is equipped with small, compact hinge-side components, leaving for additional security, up to burglary resistance grade 2 (WK2). The anti-jemmy device is integrated as standard in the corner hinge.

Straight forward: Designo is completely integrated

All of Roto NT Designo's components are perfectly matched with the Roto NT modular system. This considerably reduces installation time and expense.

Generally speaking, Roto NT Designo is easier to install; both automatically and manually. The hardware is simply positioned in the corners, avoiding installation errors. One man installation is also easy.

As with Roto NT, Roto NT Designo can be installed automatically on window sashes.
