

## PRESS RELEASE

### Monitor Mask® Completes Initial Close of Series A Fundraising

Seattle, WA – December 9, 2015 – Monitor Mask, a medical device company providing face mask solutions for sedation anesthesia, has just completed the initial close for its Series A preferred equity fundraising round.

“Now that we have already launched sales of the CapnoVue® face mask, the Series A fundraise will enable us to scale and grow our business” said Mark Kraus, CEO.

Prior funding for Monitor Mask was raised via three rounds of convertible notes. With this initial close, all convertible notes have converted to equity. The use of funds include: scale and grow the sales and marketing efforts, building out a national sales network, inventory costs, and higher volume tooling that allows for more efficient manufacturing.

Monitor Mask’s capnography products are the most versatile and convenient devices to meet the procedural and safety requirements of today’s healthcare facilities. Currently the company markets and sells the CapnoVue® M1 face mask. It provides an optimized solution for providing CO<sub>2</sub> sampling for sidestream capnography during sedation anesthesia. Additional products are planned for introduction in 2016. The primary market is hospital and ambulatory surgery center ORs, with further applications within other areas of medical practice, such as the ED, PACU, ICU, EMS, and cath lab where capnography monitoring is utilized.

### About Monitor Mask

Monitor Mask Inc. was founded by a practicing anesthesiologist to reinvent standard respiratory devices for modern practice. The CapnoVue M1 and future Monitor Mask devices feature a unique face mask sampling port configuration and features that address the specific needs of various medical procedures.
