## MODULAR CHANNEL STEREO MODEL 8755DM

INST/MIC/LINE 1 - switch selects the input signal. MIC-20/LINE 2-3 position switch, only active when the input switch is set to 'MIC', default position middle (mic in - no pad). Selecting LINE 2 selects the LINE 2 inputs on the rear panel which go through the input transformers and preamps.

## INPUT Control - control

 the input level. This control can be set to allow headroom for the eq, filters, and compressor, orHIGH PASS/LOW PASS FILTERS - self oscillate at PEAK (resonance) setting greater than 8. The peaks have substantial amounts of gain, when adding (especially HPF) use the INPUT control to allow ample headroom
 shelves and fully sweepable mid band. The tial amounts of gain, when adding (especially low) use the INPUT control to allow headroom

PEAK/RMS COMPRESSOR FLOATING SWITCH - start with BEHAVIOR at Engages a final output 0 , adjust THRESHOLD for CEILING limiter ** compression, then raise BEHAVIOR to 'magnify' the envelope. Pull THRESHOLD for RMS (attack and release disabled) Unity for MAKEUP is Unity for MAKEUP i
this control has an this control has an (and distorts well!)

CEILING limiter ${ }^{* *}$
SC POST/PRE - determines were the compres sion detector is fed, either pre filters, or post eq EQ FEED/DRY FEED determines whether the

DRY FEED - dry fader (pre or post eq)
COMP FEED - fed directly from the compressor pre drive control and saturation
SAT FEED - the full signal path, filters - eq -drive stages The FEED pots are attenuators, unity is 10

When EO and COMP are not in circuit (switches down), their inputs are fed directly from the input fade and they are no longer in the main (SAT feed) signal path, and no longer feed or effect the DRIVE and harmonics amplifiers. Their respective output signals are then still available at the DRY/EQ feed, and COMP feed, now in parallel with the harmonics amplifiers (SAT feed)

## BANOWITTH CONTROL-

GAIN LEFT/RIGHT -

is patched) level)

DRIVE - Sets the amount of harmonics/saturation through the MAS/SAT/HEX stages, 5 is unity. This allows the harmonics stages to be driven without overdriving the preceding filters and EO stages (using the INPUT

4
VE - Sets the amount HEX AMPLIFER STAGES Engages the 3 harmonics amp stages, in series from highest to lowest headroom. *MAS is a 3 way toggle to select stronger 2nd or stronger 3rd harmonic

## MODULAR CHANNEL STEREO MODEL 8755DS

INSTR/PRE/LINE - switch selects the input signal. Selecting PRE routes the ine input signal through the Preamps, making the GAIN controls active,
allowing the front end to be driven. Note that the signal from the preamps is the bypass signal, so if the GAIN knobs are set high, bypassing the unit can result in loud volumes.

## INPUT Control - control

 the input level. This control can be set to allow headroom for the eq, filters, and compressor, orHIGH PASS/LOW PASS FILTERS - self oscillate at PEAK (resonance) setting greater than 8. The peaks have substantial amounts of gain, when adding especially HPF) use the NPUT control to allow ample headroom
 shelves and fully sweepable mid band. The bands also have substantial amounts of gain, when adding (especially low) use the INPUT control to allow headroom

PEAK/RMS COMPRESSOR FLOATING SWITCHstart with BEHAVIOR at Engages a final output 0 adjust THRESHOLD for CEILING limiter * compression, then raise BEHAVIOR to 'magnify' the envelope. Pull THRESHOLD for RMS (attack and elease disabled) Unity for MAKEUP is 5 his control has an extreme amount of gain (and distorts well!)
