

# Exploring Changes to Road and Rail Noise Modelling in Ontario

Peter VanDelden  
Senior Noise Specialist

RWDI

## Outline

- Background
- Needs and Challenges
- Selection
- Proposal
- Discussion and Questions
  - Reaction
  - Implementation

## Outline

- Background
- Needs and Challenges
- Selection
- Proposal
- Discussion and Questions
  - Reaction
  - Implementation

## Background

- Initiated by MTO, MOE, Metrolinx Joint Steering Committee
- Both **road** and **rail** noise models

Road	Rail
Highway	Heavy Rail
Arterial Road	Light Rail Transit
Bus Transit	Subway

Project Goal:  
**Best Noise Prediction Model for Ontario**

- Study reports for road and rail
- Technical peer review
- Consultation with stakeholders
- Implementation

<i>algorithm</i>	One or more calculation descriptions (e.g. equations) that define how a result is obtained	
<i>emission algorithm</i>	Source calculation: type, quantity, speed, method of operation	
<i>propagation algorithm</i>	Surroundings calculation: distance, topography, obstacles, ...	

## Background - Definitions

*model* The package of algorithms that are used to produce results  
Includes source algorithms and propagation algorithms

*software* A computerized interface that interprets the model

7

## Outline

- Background
- Needs and Challenges
- Selection
- Proposal
- Discussion and Questions
  - Reaction
  - Implementation

8

## Needs

- Current emissions data
- Current computing standards
- Usability
  
- Integration with other models and data
- Visualization

## Challenges

- Staying current with changes
  - Source emissions
  - Operating hardware and software
- Ability vs. accessibility
- Remain free from bias

## Outline

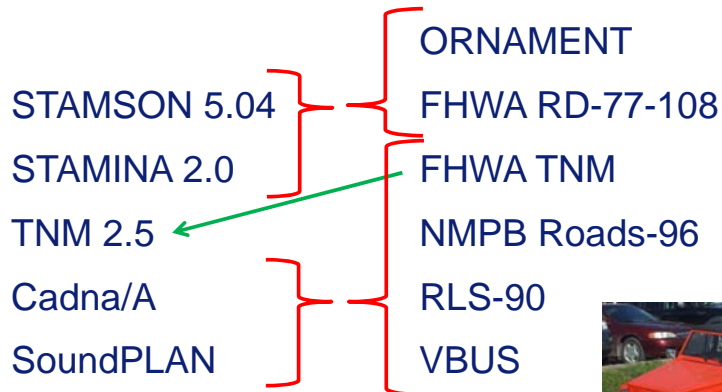

- Background
- Needs and Challenges
- **Selection**
- Proposal
- Discussion and Questions
  - Reaction
  - Implementation

## Selection - Method

- Detailed look at models and software
  - Software versus needs
  - Software versus software
  - Model versus model
- Reviewed:
  - Common North American models
  - Selected European models
  - Common North American software

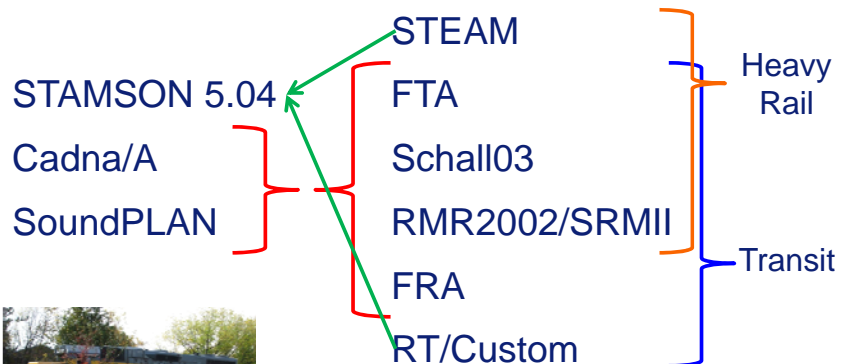

## Selection – Road Models

- **Road** noise models and software

## Selection – Rail Models

- **Rail** noise models and software

## Selection - Method

- Models compared by applying test cases
  - systematic selection of inputs
  - Inputs represent typical applications
- Validation against measurements is not part of this process
  - Comparison with measurements have already been done

15

## Selection - Models

- Models vary in complexity of each part
  - Source characterization
  - Ground effects
  - Barriers
- Models are therefore not easy to directly compare
- The application of test cases is the most effective comparison

16

## Selection - Models

- Example comparison of source modelling

TNM

exhaust  
aerodynamic  
engine  
tire-road

STAMSON

## Selection - Models

- Example comparison of source modelling

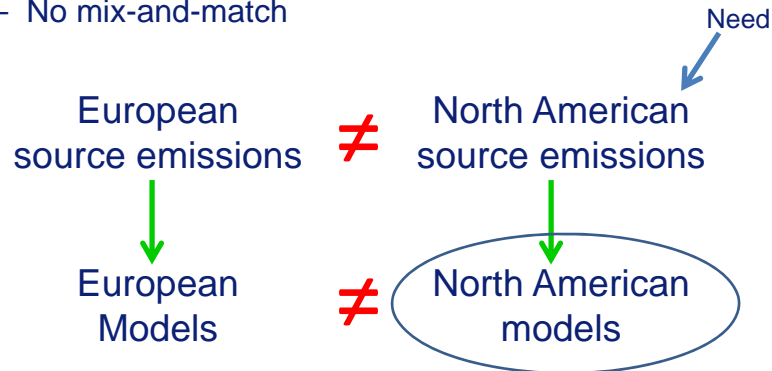

exhaust  
aerodynamic  
engine  
wheel-rail

## Selection

- Looked at emissions and propagation algorithms separately
  - No mix-and-match

## Selection - Software

- Software interprets the model
  - Strong definition provides less interpretation
    - e.g. division of segments, definition of terrain

- Interpretation results in output variance

- Software ability is limited by processing power
  - Faster computation
  - Graphical presentation

STAMSON	Cadna/A & SoundPLAN
point-to-point only	grid calculations
no visualization	3-D representations

- Current software is functionally comparable
- Software continues to develop
  - Market demand
  - Competition
  - Allows for algorithm currency
- Software manufacturers provide impetus for model improvement

## Outline

- Background
- Needs and Challenges
- Selection
- **Proposal**
- Discussion and Questions
  - Reaction
  - Implementation

## Proposal - Algorithms

Source	Model
Road	TNM
Heavy Rail	FRA
Rail Transit	FTA

- TNM starting with version 2.6
- FTA whistle for Rail Transit
- FRA whistle software for Heavy Rail

- Conditional use of software packages:
  - Test cases
  - Specified tolerance in results
  - Manufacturer demonstrates compliance
  - Settings used for compliance are published as a user guide
- Result: Freedom of software choice

- Internationally recognized algorithms and software
- Consistent with future FHWA practice
- Some local implementation guidance may be needed

## Outline

- Background
- Needs and Challenges
- Selection
- Proposal
- Discussion and Questions
  - Reaction
  - Implementation

## Your feedback is requested

- Please provide feedback:
  - As part of this discussion
  - On feedback forms
  - In person afterwards
  - By email to: [peter.vandelden@rwdi.com](mailto:peter.vandelden@rwdi.com)

# THANK YOU
