

***Illex* AP Informational Document - APRIL 2013**  
**Jason Didden**

**\*\*Note - Data Sources for the following are generally from unpublished NMFS Survey, Dealer, VTR, Permit, and MRFSS databases unless noted...everything should be considered preliminary at this point.**

### **Basic Biology**

The age and growth of *Illex* has been well studied relative to other squid species, being one of the few for which the statolith ageing method has been validated (Dawe *et al.* 1985). Based on a statolith age analysis, *Illex* squid residing in US waters have a maximum lifespan of about 215 days (about 7 months, Hendrickson 2004).

*Illex* is a terminal spawner with a protracted spawning season. The only confirmed spawning area is located in the Mid-Atlantic Bight where the winter cohort spawns during late May (Hendrickson 2004). Spawning may also occur offshore in the Gulf Stream/Slope Water frontal zone, where *Illex* sp. paralarvae have been collected (O'Dor and Balch 1985; Rowell *et al.* 1985), and south of Cape Hatteras, during winter, where *Illex* sp. hatchlings have been collected (Dawe and Beck 1985).

*Illex* feed primarily on fish, cephalopods (i.e. squid) and crustaceans. Fish prey include the early life history stages of Atlantic cod, Arctic cod and redbfish (Squires 1957, Dawe *et al.* 1997), sand lance (Dawe *et al.* 1997), mackerel and Atlantic herring (O'Dor *et al.* 1980, Wigley 1982, Dawe *et al.* 1997), haddock and scalping (Squires 1957). *Illex* also feed on adult capelin (Squires 1957, O'Dor *et al.* 1980, Dawe *et al.* 1997), smelt and mummichogs (O'Dor *et al.* 1980). Cannibalism is significant, and *Illex* also feed on longfin squid (Vinogradov 1984). Maurer and Bowman (1985) have demonstrated a seasonal shift in diet. When *Illex* are offshore in the spring, they primarily consume euphausiids, whereas they consume mostly fish and squid when they are inshore in the summer and fall. Individuals 2.4-4 in (6-10 cm) and 10.4-12 in (26-30 cm) ate mostly squid, 4.4-6 in (11-15 cm) *Illex* ate mostly crustaceans and fish, and those 6.4-8 in (16-20 cm) ate mostly crustaceans. Perez (1994) also demonstrated *Illex* consume less crustaceans and more fish as they grow larger.

*Illex* are an important prey species and are known to be preyed upon by many pelagic and demersal fish species, as well as by marine mammals, seabirds, and longfin squid (Butler 1971, Vinogradov 1972, Maurer 1975, Buckel 1997, Langton and Bowman 1977, Lilly and Osborne 1984, Templeman 1944, Stillwell and Kohler 1985, Scott and Scott 1988, Squires 1957, Wigley 1982, Major 1986, and Brown *et al.* 1981).

## Status of the Stock

The *Illex* stock was most recently assessed at SARC 42 (2006). SARC 42 was publically available in 2006 and included data through 2004. It was not possible to evaluate current stock status because there are no reliable current estimates of stock biomass or fishing mortality rate. In addition, no projections were made in SAW 42. SAW 37 (the previous assessment) also could not evaluate current stock status because there were no reliable estimates of absolute stock biomass or fishing mortality to compare with existing reference points. However, based on a number of qualitative analyses, it was determined that overfishing was not likely to have occurred during 1999-2002.

A portion of the stock seasonally resides and is also fished outside US waters, but that landings have been mostly from US waters, during most years, since 1998 (Hendrickson and Showell 2010). Also, the northern stock component, extending from Newfoundland to the Scotian Shelf, is assessed annually and managed by the Northwest Atlantic Fisheries Organization (NAFO) based on a total allowable catch (TAC).

The NMFS Northeast Science Center has provided updates regarding *Illex* indices and recent biological data (<http://www.mafmc.org/ssc-meetings/april-30-2013>). This document should be read in conjunction with the Center's update and information from that document is not repeated here. Generally the indices and landings appear to continue to fluctuate within a typical range.

## Fishery Performance

Foreign fishing fleets became interested in exploitation of the neritic squid stocks of the Northwest Atlantic Ocean when the USSR first reported squid bycatches in the mid-1960's. By 1972, foreign fishing fleets reported landing 17,200 thousand mt of *Illex* from Cape Hatteras to the Gulf of Maine. During the period 1973-1982, foreign landings of *Illex* in US waters averaged about 18,000 mt, while US fisherman averaged only slightly more than 1,100 mt per year. Foreign landings from 1983-1986 were part of the US joint venture fishery which ended in 1987. The domestic fishery for *Illex* increased fitfully during the 1980's as foreign fishing was eliminated in the US EEZ. *Illex* landings are heavily influenced by year-to-year availability and world-market activity.

## Specification Performance

The principle measure used to manage Illex is monitoring via dealer weighout data that is submitted weekly. The dealer data triggers in-season management actions that institute relatively low trip limits when 95% of the DAH is landed. Mandatory reporting for Illex was fully instituted in 1997 so specification performance since 1997 is most relevant. Table 1 lists the performance of the Illex fishery compared to its DAH. NMFS has implemented incremental improvements to monitoring over the years so it is not likely that a 24% overage as was experienced in 1998 would reoccur.

**Table 1. Illex DAH Performance. (mt)**

*Source: Unpublished NMFS dealer reports*

Year	Landings	Quota	Percent of Quota Landed
1997	13,356	19,000	70%
1998	23,568	19,000	124%
1999	7,388	19,000	39%
2000	9,011	24,000	38%
2001	4,009	24,000	17%
2002	2,750	24,000	11%
2003	6,391	24,000	27%
2004	26,097	24,000	109%
2005	12,011	24,000	50%
2006	13,944	24,000	58%
2007	9,022	24,000	38%
2008	15,900	24,000	66%
2009	18,418	24,000	77%
2010	15,825	24,000	66%
2011	18,797	23,328	81%
2012	11,709	22,915	51%
