Low AMH and natural conception

Dr. Phil Boyle

Galway, Ireland

IIRRM Annual Meeting, 7th August 2013

- AMH levels are commonly measured in fertility clinics to assess ovarian reserve and give an indication of female fertility potential.
- AMH levels are useful in deciding on stimulation protocols for IVF cycles.
- High AMH levels are useful to confirm a diagnosis of polycystic ovaries.
- Currently AMH levels cannot be used to predict a couple's ability to conceive naturally.

Bhide, P., The role of anti-müllerian hormone as a predictor of ovarian function. <u>The Obstetrician and Gynaecologist.</u> July 2012 Volume 14, Issue 3, pages 161–166

AMH

- Granulosa cells of ovary
- Indicate size of antral follicle pool
- Predict ovarian response to stimulation
- Tailor treatment to individual

Bhide, P., The role of anti-müllerian hormone as a predictor of ovarian function. <u>The Obstetrician and Gynaecologist.</u> July 2012 Volume 14, Issue 3, pages 161–166

A rise in age related subfertility

Poor ART outcomes with

Advanced age

Reduced ovarian volume

Reduced antral follicle count

Elevated FSH

Reduced AMH – since 2005

AMH levels

Constant through cycle

Decline in

pregnancy

Hormonal contraception – over 1 year use

GNRH use - zoladex

AMH Assay

There are 2 different assays used by labs

- 1) Immunotech- Beckman (Higher Readings)
- 2) DSL (5-7 times lower)

Follow reference ranges of lab

Note a 3rd standardised test is in development

AMH Assay

Furthermore results can be reported in pmol/l or ng/ml The conversion factor is 1 pmol/l = 7.14 ng/ml

Therefore if AMH is 1 it could be as high as 1 pmol/l which is equal to 7.14 ng/mland converted from DSL to Beckman (x5) = 35.7 ng/ml

So check the reference range for your lab before interpreting a result!

• Low levels

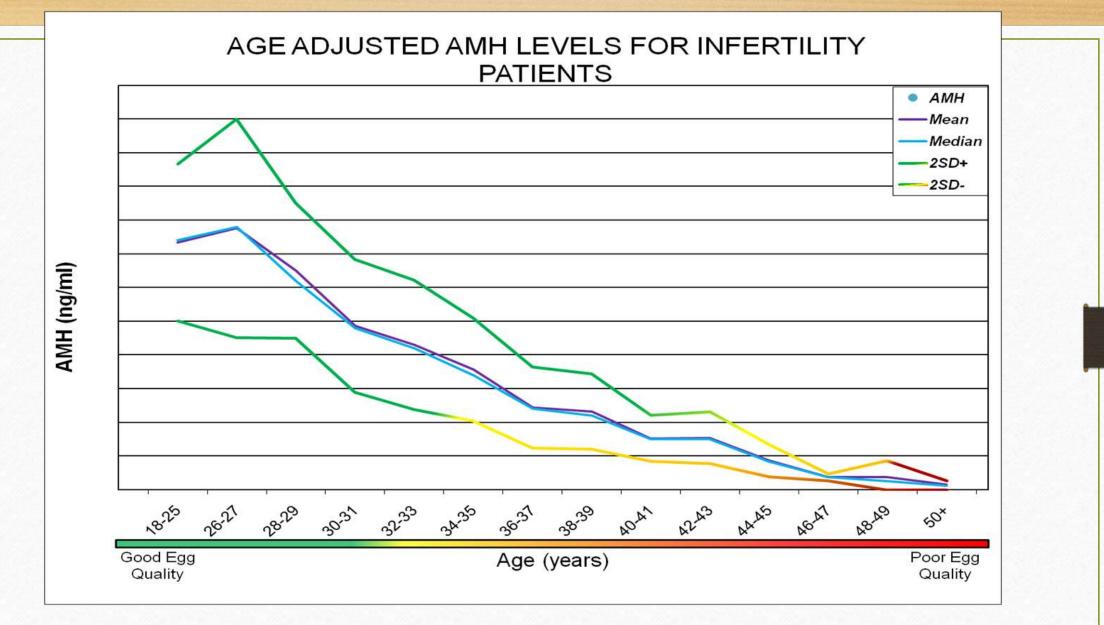

- Low antral follicle pool
- Reduced ovarian reserve
- High Levels
 - PCOD

• Reduced Ovarian Reserve

- Age
- Blood
 - FSH >10 iu, Oestradiol, Inhibin B, AMH
- Ultrasound
 - Ovarian Volume<3cm², Antral Follicle count <3
- Challenge tests

• AMH

- Age Normogram
 - Wide variation at individual ages
 - Influenced by race and BMI
 - Needs validation <u>cannot</u> be used in clinical practice

USE with caution – cannot predict ability to conceive or onset of menopause

• AMH Studies

- Are in IVF Population
- Cannot predict ability to conceive naturally
- Cannot predict the age of menopause
- BUT extremely low levels are considered a reliable guide

• AMH

- Main value is in IVF adjusting stimulation protocols
- Role in natural conception still needs to be clarified but it shows potential that it may be helpful in the future

Low AMH and natural conception

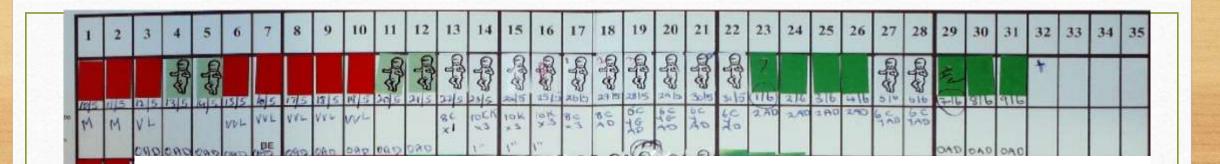

- Commonly women with low AMH levels are advised to consider donor eggs through IVF, with minimal attempt at natural conception.
- This paper attempts to show that ovarian stimulation with natural conception is a reasonable option to consider for women with low AMH.

Materials and Method

- Three cases of couples with low AMH, who were previously advised that their best option for conception was with donor eggs through IVF.
- Couple 1 AMH levels 0.07pmol/l (0.5ng/ml)
- Couple 2 AMH levels 3.2pmol/l (22.8ng/ml)
- Couple 3 AMH levels 2.8pmol/l (19.9ng/ml)

- Gravida 0, Para 0. Female and male aged 36 years old. Previous FSH 45iu/l on day 9 of cycle. AMH 0.07pmol/l, (Medlab) in June 2011. Previously advised not suitable for IVF or ICSI.
- Advised HRT, Donor Eggs and IVF.
- Intercourse without contraception since June 2006 6 years. Cycles irregular 26-47 days. No previous semen analysis or Laparoscopy.

- First consultation Galway Clinic June 2012.
- Repeat FSH on day 3 of cycle FSH 24.8 IU, LH 6.7 IU, Oestradiol 58 pmol/l
- Record markers of fertility with Creighton Model FertilityCare Chart (Standardised Billings)
- Supplements with vitamin D3, omega 3 and folic acid and Dietary strategy
- Semen analysis

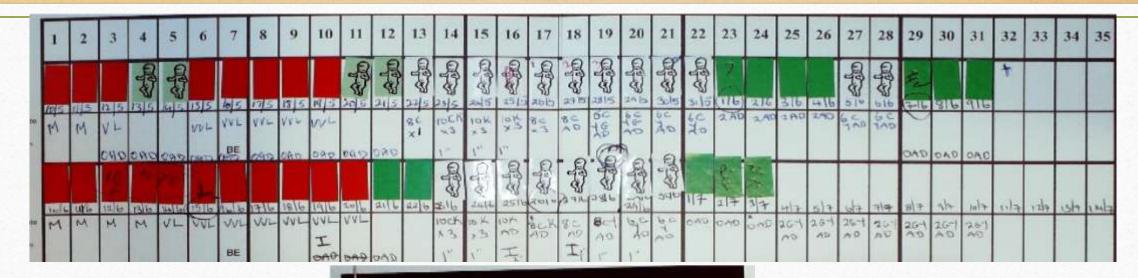

Letrozole 2.5mg – 10 tabs day 3 HCG 10,000 iu mid cycle prednisolone 5mg mane naltrexone 3mg nocte

Ultrasound follicle tracking to monitor follicle development and rupture

Blood test on day 7 after ovulation for progesterone and oestradiol

- Result Conceived on first cycle of ovulation induction, second cycle of charting.
- Pregnancy Consultation August 2012

- Positive Foetal Heart
- CRL = 14.8mm , 7weeks and 6 days
- EDD 22nd March 2013

- Treatment during Pregnancy
 - Cycogest 400mg pv twice daily
 - Fematab 2mg bd po twice daily
 - Naltrexone 3mg nocte
 - Prednisolone 5mg mane
 - Supplements Vitamin D3 and Folic Acid

- Monitored progesterone and oestradiol during pregnancy
 - Cycogest 400mg pv twice daily Stopped at 24 weeks
 - Fematab 2mg bd po twice daily Stopped at 24 weeks
 - Naltrexone 3mg nocte stopped at 20 weeks
 - Prednisolone 5mg mane stopped at 28 weeks
 - Supplements Vitamin D3 Stopped at 38 weeks

- Vaginal delivery with Forceps.
- Full term 22nd March 2013
- Birth Weight 9lbs 0 oz. (4.082 KG)
- Complications None

- Presented in May 2012
- History Gravida 1 Para 0. Female 35 years. Male 36 years.
- Intercourse without contraception for 5 years, since June 2007.
- Laparoscopy Mild endometriosis 2009. Hysteroscopy normal Nov 2011.
- Semen analysis normal. Day 3 bloods and clotting studies normal. AMH 3.2 pmol/l.
- 4 cycles of IVF 3 stimulated cycles and 1 donor egg cycle in Czech Republic all unsuccessful.

- Repeat FSH on day 3 of cycle
- Record markers of fertility with CrMS.
- Naltrexone 4.5mg nocte for clinical endorphin deficiency
- Supplements
 - Vitamin D3, Omega 3, ALA, Vit. C, folic acid and Dietary strategy
- Blood test on day 7 after ovulation for progesterone and oestradiol

- Results
 - Day 3 bloods normal FSH 4.6 IU, LH 3.0 IU,
 - Creighton Model FertilityCare Chart Brown menstrual bleeding
 - Suboptimal levels of progesterone 36.7 nmol/l, on day 7 after ovulation
 - Normal oestradiol 618 pmol/l

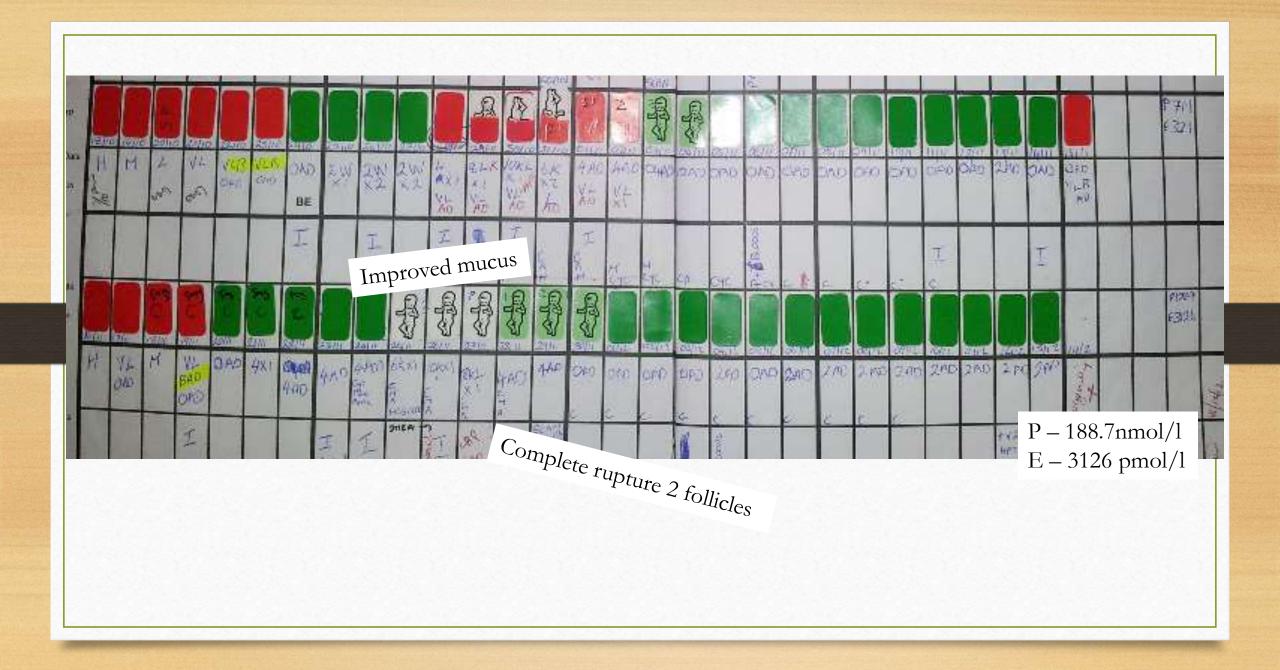

- Initial Treatment
 - Letrozole 2.5mg 5 tabs on day 3 of cycle
 - HCG 10,000 iu 19 mm follicle
 - Cyclogest 400mg pv nocte x 10 nights on day 3 after ovulation

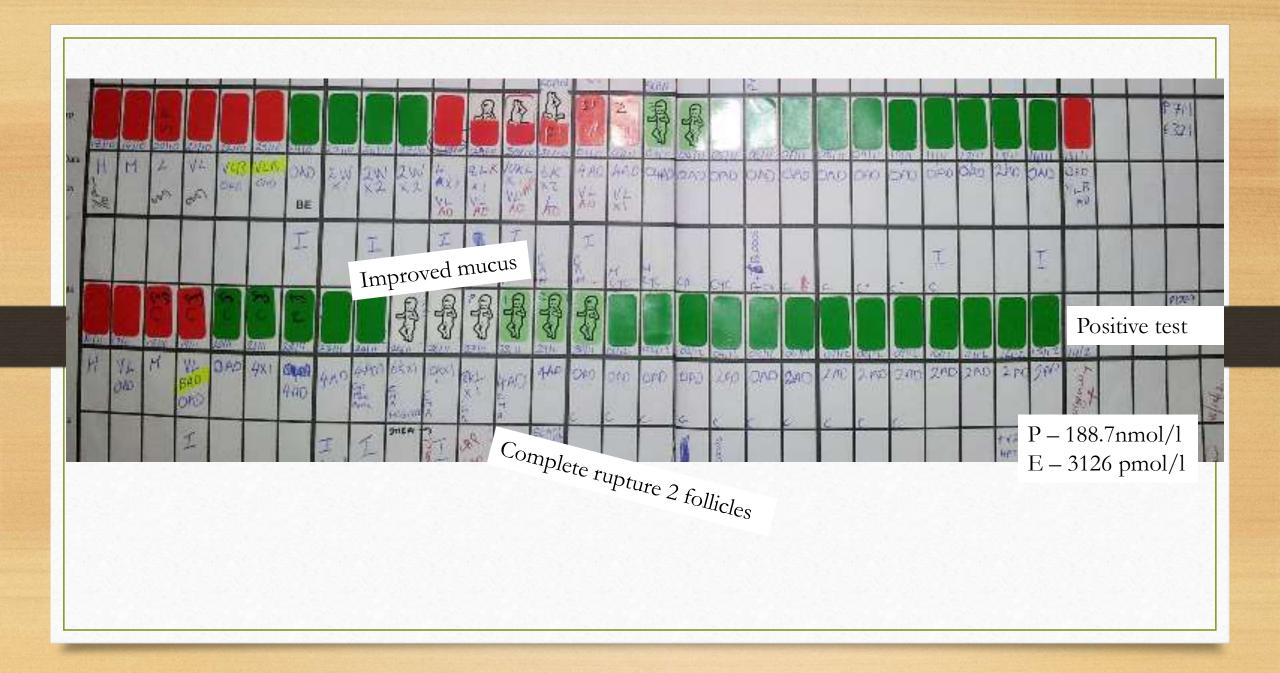

- Results
- Fertility Chart
 - Limited cervical mucus flow
 - Mid cycle spotting
- Ultrasound Follicle Tracking
 - Partial –incomplete rupture

- Adjusted treatment
 - Clomiphene 50mg daily x 5 days from day 3 of cycle
 - HCG 15,000 iu 19mm follicle
 - Cytotec 200mcg nocte for 5 days from day 11 of cycle
 - DHEA 25mg tid x 30 days
- Ultrasound follicle tracking confirmed rupture of 2 follicles.

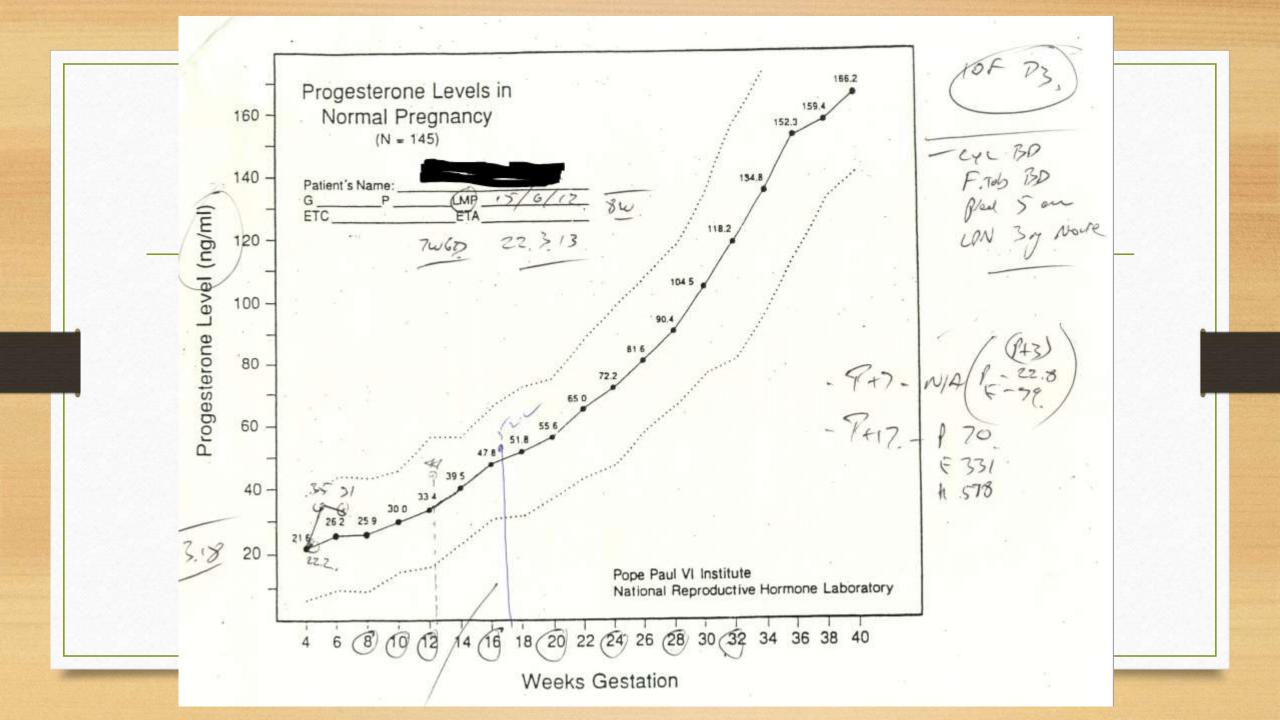

- Pregnancy Consultation
 - Positive Foetal Heart 153 /min
 - CRL = 11mm , 7weeks and 2 days
 - EDD 21st August 2013

- Treatment during Pregnancy
 - Cycogest 400mg pv twice daily ongoing
 - Fematab 2mg po twice daily ongoing
 - Prednisolone 25mg mane until 12 weeks, continue 5mg mane until 28 weeks
 - Naltrexone 4.5mg nocte to stop at 38 weeks
 - Supplements Vitamin D3 to stop at 38 weeks
- Pregnancy ongoing as of 15th July- 34 weeks

Blood date	Gestation	Prog nmo	Prog ng/n	Oestradiol

- Presented in Nov 2011
- History Gravida 1, para 1. Female 36 years. Male 46 years. First pregnancy occurred after 12 months trying. Live birth in Aug 2007. Forceps delivery, 3rd degree tear.
- Trying since Jan 2008. Nearly 4 years. Cycle 28-34 days. Laparoscopy Apr 2010 normal. Semen analysis normal. Routine bloods normal. Ultrasound normal –
- Previous diagnosis of unexplained Infertility. 3 cycles of clomiphene and 6 cycles of menopur with ovitrelle. Follicle tracking to point of mature follicle rupture never confirmed.
- First IVF March 2011 poor ovarian response cancelled.
- Second IVF Aug 2011 6 follicles, 4 embryos fragmented 3 replaced no success.
- AMH 2.8 nmol/l. Advised donor eggs with IVF.

- Repeat FSH on day 3 of cycle
- Record markers of fertility with Creighton Model FertilityCare Chart
- Supplements with vitamin D3, omega 3 and folic acid and Dietary strategy
- Naltrexone 4.5mg nocte for clinical endorphin deficiency
- Blood test on day 7 after ovulation for progesterone and oestradiol.
- Refer for repeat Laparoscopy persistent dysmenorrhoea.

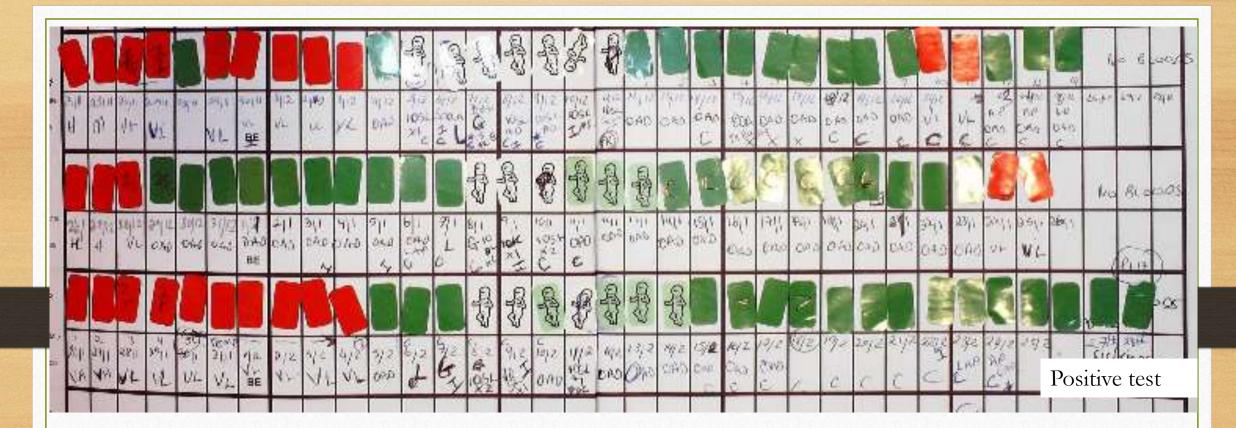

Fertility Chart

good mucus with ovulation event day 14, abnormal bleeding - premenstrual spotting 2-4 days. Low Progesterone and oestradiol day 7 after ovulation

- Reduced ovarian reserve FSH 17.9 IU, LH 4.9 IU,
- Suboptimal levels of progesterone 39.6 nmol/l, oestradiol 243pmol/l
- Mild endometriosis and 1.5cm fimbrial cyst treated.

- Initial Treatment
 - Clomiphene 100mg daily for 3 days
 - HCG 15,000 iu 19 mm follicle Partial Follicle rupture
- Adjusted treatment
 - Letrozole 2.5mg 6 daily x 2 days from day 3 of cycle
 - HCG 15,000 iu 19mm follicle
 - Cytotec 200mcg nocte for 5 days from day 11 of cycle
 - Still Partial Follicle rupture

- Final treatment
 - Letrozole 2.5mg 7 tabs daily x 2 days from day 3 of cycle
 - Cytotec 200mcg nocte for 5 days from day 12 of cycle
 - Lenograstim (G-CSF) 17million iu (0.5ml) day 12 of cycle
 - HCG 15,000 iu day 13 of cycle
 - Cyclogest 400mg pv nocte x 10 nights from day 3 after ovulation
 - Naltrexone 4.5mg nocte
 - Prednisolone 2.5mg mane
- <u>Complete follicle rupture</u>

Conceived on 3rd cycle of modified treatment. - Chart 3

Makinoda, S. Granulocyte Colony-Stimulating Factor (G-CSF) in the Mechanism of Human Ovulation and its Clinical Usefulness. *Current Medicinal Chemistry* 2008: Volume 15, Number 6, 604-613(10)

- Pregnancy Consultation
- Positive Foetal Heart 152 /min
- CRL = 15.5mm, 7weeks and 6 days
- EDD 2nd Nov 2013

- Treatment during Pregnancy
 - Cycogest 400mg pv twice daily stopped at 12 weeks
 - Fematab 2mg po once daily daily stopped at 15 weeks
 - Prednisolone 5mg mane to stop at 24 weeks
 - Naltrexone 3mg nocte to stop at 38 weeks
 - Supplements Vitamin D3 to stop at 38 weeks
- Pregnancy ongoing as of 9th May 2013 15 weeks

RESULTS

- Three couples had successful ovulation induction and natural conception without the need for any artificial intervention.
- One couple had a full term live birth of a male infant weighing 9lbs (4,082g) in March 2013. The remaining couples are due to deliver in August and November 2013 respectively.

CONCLUSION

- For women with low AMH levels consider
 - Ovulation induction with letrozole or clomiphene
 - Ultrasound follicle tracking with complete follicle rupture
 - Monthly blood test progesterone and oestradiol day 7 after ovulation
 - Standardised Fertility Chart

Finallyconsider the alternative

- Donor Eggs Irish Fertility Clinic 2007-2012
 - 104 pregnancies
 - Mean female age 40years range 28 -49
 - Singleton 73 (70%), Twins 22 (21%), Triplets 9 (9%)
 - 46% had major antenatal complications
 - Hypertension 26% of pregnancies overall (45% of twins)
 - One singleton pregnancy very severe- early onset PET 19 weeks had liver capsule rupture, laparotomy and hysterotomy

Finallyconsider the alternative

- Donor Eggs Irish Fertility Clinic 2007-2012
 - Preterm delivery rate of 28%,
 - 11% for singletons with one at 28 and other at 31 weeks
 - 54% (12/22) for twins -32-36 weeks
 - 9% triplets all delivered by c section 5 sets very preterm
 - Over all C section rate of 77%
 - NICU 16% singletons, 32% twins and all triplets. 2 fetal deaths at 19 and 32 weeks.

Premature Ovarian Failure

2 Case Reports

1. FSH 23iu

2. AMH 0.07pmol/1

Premature Ovarian failure

- April 2008, 35yo G0 P0
- 18-30 day cycle
- DX Premature Ovarian failure
 - Raised FSH 23.7iu

Premature Ovarian failure

- Previous Treatment
 - Clomiphene x5 cycles
 - IUI x 4 cycles
 - IVF
 - Sept 2006 1 Follicle cancelled
 - Oct 2007 Flare Protocol No follicles
