2. Use an M3 screw and nut to secure the PCI backplate. Now carefully place the waterblock onto the card and line up the screw holes.

3. Flip the card over, making sure the thermal pads stay in place. Remove the tape from both sides of the thermal pads and place them on the positions shown above.

4. Place the red washers over the screw holes shown above.

5. Place the backplate on the back of the card and attach it using the black M3 screws.

6. Do not over tighten the screws as this may bend the card and cause permanent damage.

The card is now ready for use. When you first boot it is advisable to use ATItool or other monitoring software to check the core temperature. If the temperature is high you will need to remount the block.
