2. Flip the card over, making sure the front thermal pads stay in place. Place the red washers over the screw holes shown above and fit the eight crosshead screws on the positions marked in green. Now remove the protective film from both sides of the thermal pads and place them on the fifteen locations shown above.

3. Place the backplate on the back of the card and attach it using the allen head screws. Tighten each screw gradually and do not over tighten the screws as this may bend the card and cause permanent damage.

The card is now ready for use. When you first boot it is advisable to use monitoring software to check the core temperature. If the temperature is high you will need to remount the block.
