

Culture Feeds - "We bring algae products to the world."

At Culture Feeds, we understand the needs of the poultry industry.

Culture Algae Feed

is grown on an advanced high-tech platform that prevents external predators from contaminating the feed. Culture chicken feeds are organically grown, ensuring the highest quality with exceptional nutritional value.

Why Culture Chicken Feed?

Benefits of Algae Feeds

- Research shows a higher concentration of omega-3 (DHA) & higher nutritional content in the meats (seven times the amount of DHA) and egg yolks of hens that were fed the algae diet.
- Algae feed reduces the risk of diseases and infections, resulting in improved health and decreased mortality rate.
- Chickens that were fed algae biomass as a supplementary feed consumed 10% less feed and the serum cholesterol levels of the chicken also decreased.
- Studies have shown that overall digestibility of specified algae strains are good and can be effectively incorporated as the primary or supplementary feed for the chickens.
- Unlike conventional feed such as soy and corn, Algae is environmentally sustainable and has a smaller carbon footprint.

Culture Algae Feed (Paste)

Culture Algae Feed for Chickens (Paste)

- Fresh Algae Pastes
 - *Nannochloropsis, Spirulina, Chlorella*
- Place of Origin - United States
- 20% Dry Weight
- Algae cultivated through a controlled process
 - Maintains uniform properties
 - Reduced risk of contamination
- Organic Feed with high nutritional value
- Centrifuged on site
- Produce as a replacement for live algae
- Storage for up to 2-3 months without expiration
- We are able to produce and distribute between 1 and 20 tons

Culture Feeds Technology Process

- *Our primary company, Culture Fuels is a technology developer with an advanced cultivation platform which enables large-scale production of algae to be used in producing chicken feeds*
- *Increases contamination barriers so that algae do not escape and external predators do not enter*
- *Results in higher biomass density*
