# COMMUNITY WILDFIRE PROTECTION PLAN

# LEEWARD HALEAKALĀ MAUI, HAWAI'I DECEMBER 2020

Coordinated and developed by Hawai'i Wildfire Management Organization, in partnership with Hawai'i Department of Land and Natural Resources, Division of Forestry and Wildlife. Funded by the USDA Forest Service Landscape Scale Restoration Program This page intentionally left blank

## MUTUAL AGREEMENT SIGNATURE PAGE

The following three entities mutually agree to the final contents of this Leeward Haleakalā Community Wildfire Protection Plan: State of Hawai'i Department of Land and Natural Resources, Division of Forestry and Wildlife; Maui Fire Department; and Maui Emergency Management Agency.

## This plan:

- Was collaboratively developed by agencies, entities, community members, and individuals with interest or jurisdiction in Leeward Haleakalā, Maui.
- Describes wildfire hazards in the natural and built environment.
- Provides the concerns, recommended actions, and priorities of those who live and work in the area to better reduce wildfire threats, mitigate hazards, improve public safety, and protect natural resources from the impacts of wildfire.
- Is written to appropriately begin and inform wildfire mitigation action planning at the local level, and is not regulatory or binding.

Pursuant to the 2003 Healthy Forest Restoration Act (HFRA), the following signatures represent mutual agreement of the contents of this CWPP.

Merr

David G. Smith
Administrator
Department of Land and Natural Resources
Division of Forestry and Wildlife

Brad Ventura

Brad Ventura
Acting Fire Chief
Maui Fire Department

Almen freggt

Herman Andaya
Administrator

# EXECUTIVE SUMMARY

This Community Wildfire Protection Plan (CWPP) was developed by the Hawai'i Wildfire Management Organization (HWMO) with guidance and support from government agencies and representatives, private resource management entities, community members, and decision makers concerned about wildfire issues in Leeward Haleakalā, Maui, Hawai'i. State of Hawai'i Department of Land and Natural Resources- Division of Forestry and Wildlife (DLNR-DOFAW) was the primary partner in carrying out this CWPP process.

The Leeward Haleakalā CWPP focuses on wildfire preparedness and readiness, hazard assessment and reduction, and the wildfire mitigation priorities of those who live and work in the area. The process used to develop this plan engaged a diversity of agencies and individuals concerned with the at-risk area, following the guidelines and requirements of federal programs such as the Federal Emergency Management Agency (FEMA) Pre-Disaster Mitigation program and the National Fire Plan (NFP).

Stakeholder participants in the development of this plan agree that wildfire threats are imminent and can have widespread damage to Leeward Haleakalā watersheds, natural resources, and human communities. The danger of fire is related to high numbers of human-caused fires, dry conditions, steep slopes, high fire potential of vegetation, and challenging firefighting conditions. In the last decade, numerous areas of Leeward Haleakalā have burned. While CWPPs serve mainly as a mechanism for assessing, communicating, and preparing for wildfire collaboratively, they are not enforceable or funded. The action plans are voluntary and rely on all parties understanding they play a role in wildfire safety and protection, and taking appropriate actions toward risk reduction. A CWPP is a first step toward increased public-private collaboration toward these goals.

This page intentionally left blank

# INTRODUCTION

The communities, lands, and waters of Leeward Haleakalā, Maui, Hawai'i, have been classified as "at high risk" of wildfire occurrence and impacts. The safety of residents, and the protection of private property, community infrastructure, and natural and cultural resources, is a shared responsibility between residents and communities; owners, developers and associations; private businesses and municipal service operators; and county, state and federal governments. The aim of this Community Wildfire Protection Plan (CWPP) is to carry out wildfire protection planning and subsequent actions for Leeward Haleakalā.

# THE PURPOSE OF WILDFIRE PROTECTION PLANNING IS TO...

- Motivate and empower local government, communities, and property owners to organize, plan, and take action on issues impacting the safety and resilience of values at risk.
- Enhance levels of fire resilience and protection to the communities and infrastructure.
- Identify the threat of wildland fires in the area.
- Identify strategies to reduce the risks to structures, infrastructure and commerce in the community during a wildfire.
- Identify wildfire hazards, education, and mitigation actions needed to reduce risk.
- Transfer practical knowledge through collaboration between stakeholders toward common goals and objectives.

# **OUTCOMES OF WILDFIRE PROTECTION PLANNING...**

# 1. Improve community safety through:

- Coordination and collaboration
- Public awareness and education
- Increased wildfire prevention and preparedness

- Widespread hazard reduction efforts
- Improved wildfire response capacity
- Development of long term strategies

# 2. Catalyze efforts to guide planning and sustained implementation of actions toward:

FIRE ADAPTED COMMUNITIES

RESILIENT LANDSCAPES

SAFE & EFFECTIVE WILDFIRE RESPONSE

# PROCESS- HOW A CWPP IS DEVELOPED

- 1. The project is launched, partnerships are established, administrative and funding processes are completed.
- 2. The community risk assessment is reviewed, updated, or performed as necessary.
- 3. Opportunities are coordinated and offered for interested parties (community members, government agencies, other relevant/concerned individuals and entities) to review wildfire information, discuss concerns, identify strategies, and prioritize recommended actions.
- 4. Wildfire information and community input results are used to develop the CWPP document.
- 5. The CWPP is finalized via review and signatures of Fire, Forestry, and Emergency Management departments to meet federal compliance requisites.

# TIMELINE- THE DEVELOPMENT OF THE LEEWARD HALEAKALĀ CWPP

January 2020	DLNR-DOFAW initiated the project and worked with HWMO to complete all contract and administrative components.		
February 2020	An introductory meeting was held with the Leeward Haleakalā Fire Task Force, to lay the groundwork for a collaborative all-partner effort, agree on the process and timeline, and establish exact planning area boundaries.		
March - Aug 2020	HWMO developed fire weather and other maps for the planning document		
August 2020	Planning meeting with Leeward Haleakalā Task Force and other relevant parties to:		
	- Review the purpose, intent, and next steps for the CWPP.		
	<ul> <li>Plan collaborative workshop with relevant agencies, organizations, and community members for discussion of wildfire concerns. Select dates and times.</li> </ul>		
	<ul> <li>Discuss and determine strategy for adapting the process to COVID-19 social distancing and travel restrictions.</li> </ul>		
October 2020	Input Meeting 1: Friday Oct 23, 2020 Focus: Kanaio, Kaupo, Kipahulu,		
	Input Meeting 2: Friday Oct 30, 2020 Focus: Kahikinui		
November 2020	Community CWPP input survey was launched and circulated via email with closing date of December 15, 2020.		
December 2020	HWMO completed all background information, research, mapping, and processing of workshop input and community survey results. CWPP draft was completed.		
September 2021	Partner review of CWPP was completed. Plan was submitted for signatures.		

# PARTNERSHIPS AND COLLABORATIONS

This CWPP was developed in close collaboration with members of the Leeward Haleakalā Fire Task Force. Primary collaborators were:

Lance De Silva
Department of Land and Natural Resources
Division of Forestry and Wildlife

Andrea Buckman Leeward Haleakalā Watershed Partnership

**Bobby Ferreira** 

Kaimi Kona'aihele, Ulupalakua Ranch

Donna Sterling Ka 'Ohana O Kahikinui (KOOK)

Mike Werner Maui Fire Department

Nani Barretto Hawai'i Wildfire Management Organization

Elizabeth Pickett Hawai'i Wildfire Management Organization

## STATEMENT OF LIABILITY

A CWPP helps communities clarify and refine priorities for the protection of life, property, and critical infrastructure. It is intended to create a foundation of collaboration and communication among diverse parties toward achieving wildfire risk reduction goals.

A CWPP is not a binding, regulatory document. The action plans are voluntary. The process and the associated document are mechanisms for assessing risk, discussing, learning, and planning collaboratively across sectors and neighboring communities. This is not a pre-determined, top-down, outside-expert or single-agency-driven determination of future activities, but rather a compilation of information and priorities to inspire, inform, and guide wildfire preparedness activities. This is in line with the improved understanding across the country that everyone who lives and works in a fire prone areas has a role to play when it comes to preventing ignitions, reducing hazards, and ensuring a wildfire-informed, wildfire-ready, and wildfire-resilient community. A CWPP does not provide or guarantee funding, but does qualify entities in the area to apply for certain wildfire mitigation funding opportunities.

The activities suggested by this document, the assessments and recommendations of fire experts and officials, and the plans and projects outlined by the community, are made in good faith according to information available at this time. HWMO and DLNR-DOFAW assume no liability and make no guarantees regarding the level of success users of this plan will experience. Despite efforts to prevent or contain wildfires, fires still occur. The intention of all decisions and actions made under this plan is to reduce the potential for, and the consequences of, wildfire.

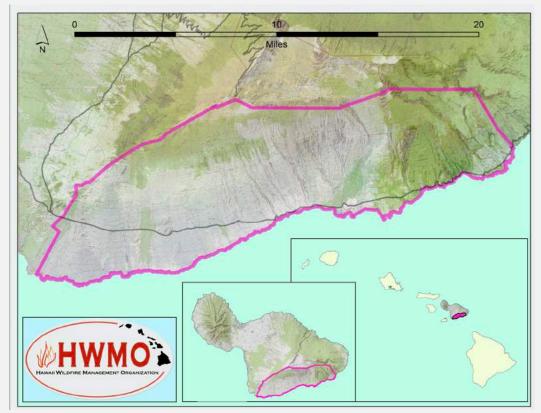

# COVID-19 STATEMENT

In an effort to maintain a highly collaborative, effective, and safe CWPP process during several variations of social and travel restrictions across the county and state, the majority of this CWPP was using virtual alternatives to in-person activities. To adapt for COVID-19, several virtual workshops were held with agency and community representatives, and a web-based survey went out to those who live and work in Leeward Haleakalā for 30 days. Any additional information, community input, and/or action plans generated will be added to this document as updates. The collaborators involved in the development of this CWPP are committed to a long-term process of community engagement and partnership.

# **PLANNING AREA**

# **CWPP BOUNDARIES**

The Leeward Haleakalā CWPP is part of a series of CWPPs across the County of Maui. Since 2014, CWPPs have been developed for the entire western portion of Maui, Upcountry Maui, Central Maui, and Moloka'i. The CWPP boundaries established for the Leeward Haleakalā plan abut the boundaries of the Central Maui CWPP (generally covering the Kihei area) to the west-northwest, and the Upcountry Maui CWPP to the north-northwest. The remaining boundaries follow the ridgeline to the eastern boundary of Haleakalā National Park (Map 1).

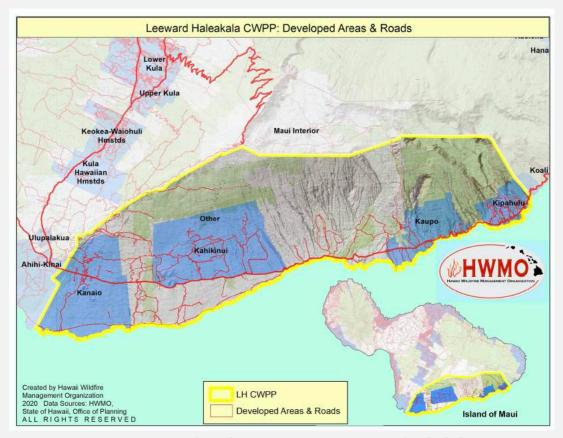

Map 1. Leeward Haleakalā CWPP Planning Boundaries.

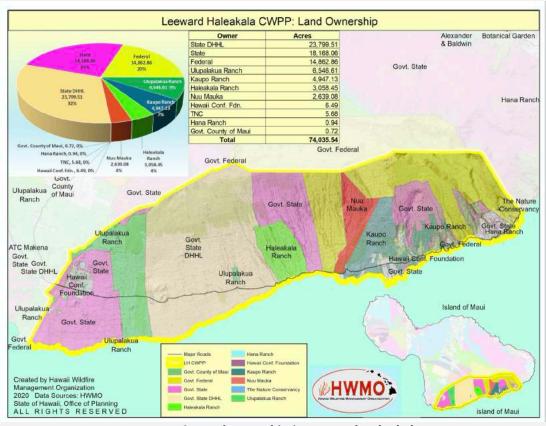

## **COMMUNITIES AT RISK**

Located in an area of Maui that is less developed and less accessible than many other parts of Maui, the region is considered at high risk of wildfire due to its arid landscape, steep slopes, frequent human-caused ignitions, long distances and emergency response times, lack of water for firefighting, copious amounts of overgrown and unmanaged fire-prone vegetation, and challenging ingress/egress.

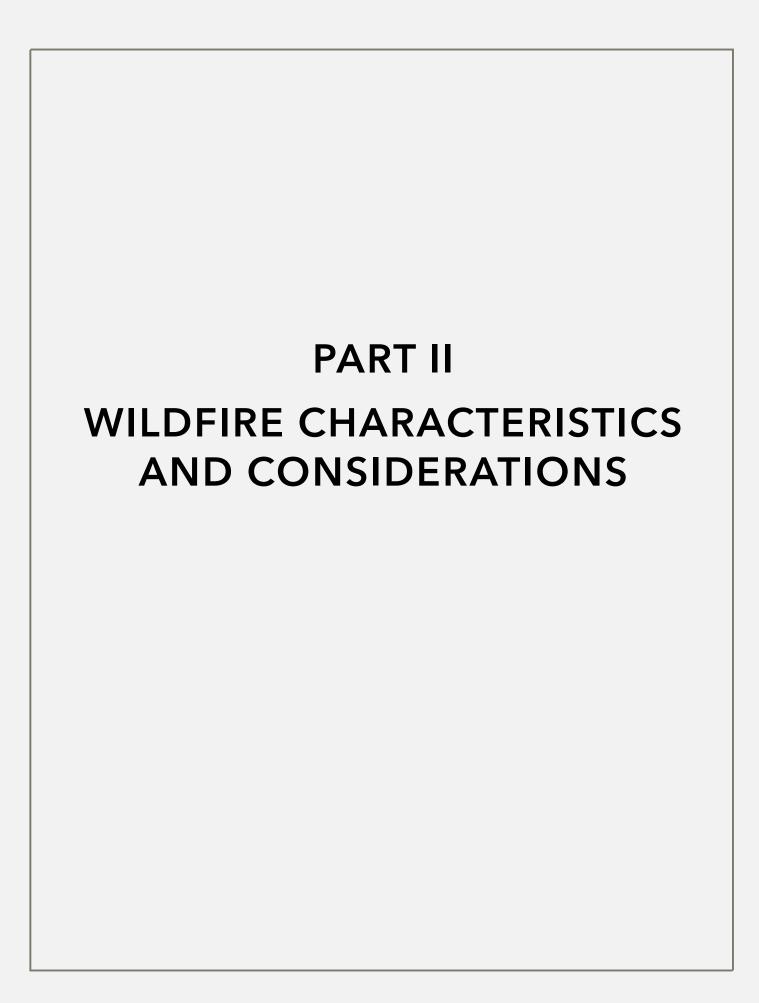

There are four main clusters of residential communities, all with populations below 1000, as per 2010 census data. For the purposes of this CWPP, they are referred to as Kanaio, Kahikinui, Kaupo, and Kipahulu (Map 2). The planning area includes government and privately owned lands (Map 3)

Map 2: Residential community areas in Leeward Haleakalā.

Map 3: Landownership in Leeward Haleakalā.

# FIRE HISTORY

# WILDFIRE OCCURRENCE

The majority of wildfires on Maui are caused by human error or arson, especially near developments, power line right of ways, and along roadsides. Additionally, sprawling dry nonnative grasslands surround many communities. These are both true for Leeward Haleakalā. Once ignited along the interface, wildfire can spread rapidly through and around residential areas, threatening property, life, critical infrastructure, and both natural and cultural resources.

When CWPP workshop participants weighed in regarding wildfire occurrence, they noted that ignitions tend to take place along highway, that they are very likely set deliberately leading to an increase in investigations, and that abandoned cars are a huge contributing factor to fire ignitions.

Recent notable fires per area are described below:

# Kahikinui Area

Aug 2020 Nine separate fires between miles 23 and 27 along the Piilani Highway. Evacuation of Kahikinui homestead for 3 hours, 65 acres burned. Nov 2019 300 acres in the area of MP 26 of Pi'ilani Highway scorched an estimated 300 acres and was fueled by strong winds. The cause of this fire is undetermined. The fire resulted in area evacuations and a temporary highway closure from Piilani Highway Milepost 25 through Kipahulu National Park. 20 Acre Fire Near Auwahi Windfarm on Maui. Pi'ilani Highway (Hwy 31) at Mile Aug 2018 Marker 20 in 'Ulupalakua was temporarily closed. Feb 2016 5,300 acre wildfire that threatened homes in Kahikinui. Evacuations ordered. Smoke impacted Leeward Haleakalā as well as Kihei. 25 acres The fire is located on the mauka side of the Pi'ilani Highway between mile 24.5 Nov 2015 and 26. The cause is undetermined. Apr 2015 2 acre fire started accidentally by a welder. Jul 2013 More than 65 acres of brush were scorched on the Ulupalakua side of Manawainui Gulch in Kaupo. may have been intentionally set because firework remnants were found at the scene.

# **Kaupo Area**

Oct 2019 Abandoned car fire. Contained before significant spread.

# Kipahulu Area

Nov 2019 Structure completely burned down. Contained before significant spread. Cause undetermined.

# **Kanaio Area**

Dec 2018 600 square foot structure completely burned down. Contained before significant spread. Cause undetermined.

Jul 2018 25 acres. Upper Kanaio Road off of Pi'ilani Highway.

# FIRE ENVIRONMENT WILDFIRE DRIVERS

The factors that contribute to wildfire occurrence and spread are a combination of fuels, topography, climate, and weather conditions during a fire event. In Leeward Haleakalā, these can stack up to yield a high risk of wildfire, rapid spread, and significant impacts from summit to sea.

Fire intensity and spread rate depend on the fuel type and condition (live/dead), the weather conditions prior to and during ignition, and the topography. Generally the relationships between fire behavior, fuel, weather, and topography are as follows.

## **TOPOGRAPHY**

Topography influences fire behavior principally by the steepness of the slope. However, the configuration of the terrain such as narrow draws, saddles and so forth can influence fire spread and intensity. In general, the steeper the slope, the higher the uphill fire rate spread and intensity.

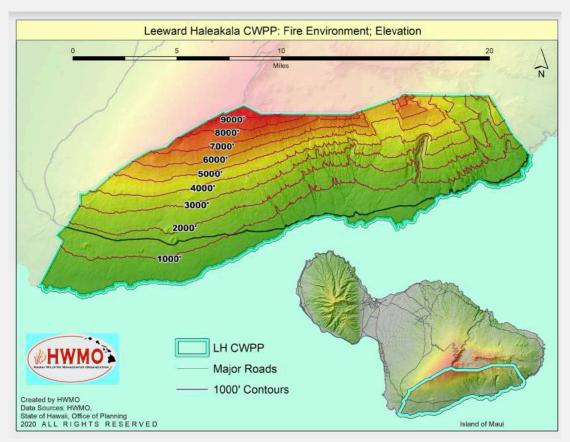

Topography influences wildfire behavior in Leeward Haleakalā in critical ways. Due to their location on the southern flank of Haleakalā, a 10,023-foot shield volcano, the residential communities across the CWPP region are mostly built on gentle to steep slopes. Homes in the region are built in a wide range of elevations spanning from 1,500 to 4,500 feet above sea level. There are several small gulches that act as drainages, and a few much larger gulches in the wildland areas surrounding the community. It is important to note that although

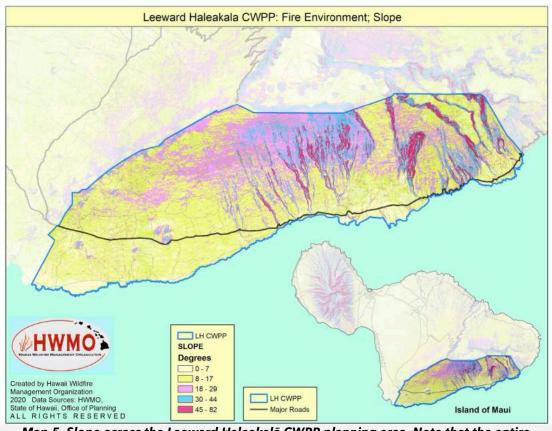

Photo 1. The entire CWPP area is sloped from sea to summit, from gentle slopes to hills to steep ravines.

gulches can act as an important water resource, they can also help channel winds either upslope or downslope. Upslope fires can be highly dangerous, especially when combined with dense, unmanaged, flammable vegetation. Slope is a high hazard for Leeward Haleakalā.

Map 4 depicts the span of elevations across the planning area. Map 5 depicts slope across the Leeward Haleakalā CWPP area. Note that elevation rises from 0 to 10,000 ft in less than 8 miles.

Map 4. Elevation across Leeward Haleakalā CWPP area.

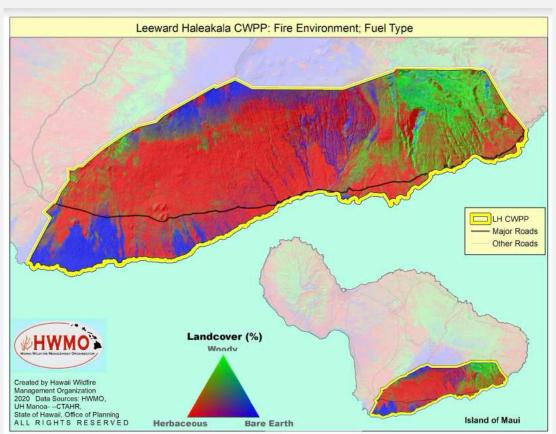

Map 5. Slope across the Leeward Haleakalā CWPP planning area. Note that the entire area is sloped, some areas with extreme gradients, due to ravines and gulches.

## **FUEL**

Fine "flashy" fuels ignite more easily and spread faster with higher intensities than coarser fuels. For a given fuel, the more there is and the more continuous it is, the faster the fire spreads and the higher its intensities. Fine fuels take a shorter time to burn out than coarser fuels.

Since Leeward Haleakalā covers a vast stretch of topographic and climatic characteristics from summit to sea, a mosaic of landcover types exist within the area. Map 5 below characterizes fuels in the CWPP area by indicating whether it is grass, woody, or bare ground. While the species also indicate level of fire hazard (detailed below), visualizing by class of vegetation such as in Map 5 is useful for understanding how easily fire will ignite (grasses are flashy, dry easily and ignite readily) and how quickly fire might spread (what type and whether it is contiguous or patchy). Patchy or noncontiguous fuels can slow the spread of fire and/or provide options for fire control.

Map 5. Fuel type: Woody/green, herbaceous (grass, shrubs, forbs)/red, and bare earth.

A large amount of land is covered by mixed grass-shrublands dominated by introduced, fire-prone species. These fuels encroach the residential areas less than 40 feet around homes and are especially prolific on unmanaged, vegetated corridors, vacant lots, and in Wildland areas.

There are three main grasses found in the direst, most fire prone areas of the Leeward Haleakalā CWPP planning area— kikuyu (Cenchrus clandestinus), redtop (Agrostis gigantea), and molasses (Melinis minutiSlora) — that all reseed and spread after wildfires. Kikuyu is the predominant grass and although it makes for great forage, it can pose difficulties for fire suppression efforts. For one, they act as one continuous fuel bed (as opposed to bunch grasses), are notorious for restarts of fires, and

are tedious to mop-up (firefighters need to dig deep to create fire lines and pull grass from between large rocks). Molasses grass will usually be the first to resprout after a fire, but the there are pockets where kikuyu has replaced molasses after the large fires.

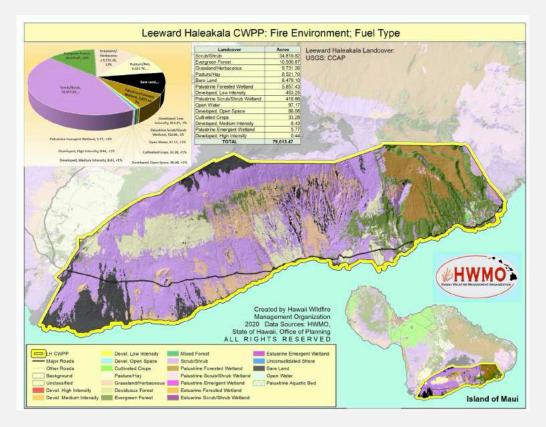

Shrubs such as lantana (Lantana camara), tree poppy (Bacoonia frutescens), and gorse (Ulex europaeus) have spread vigorously throughout Kahikinui and other areas and regenerate quickly after fires. Gorse is of particular concern— LHWRP and the community have worked hard over the years to eradicate it. The herbaceous plant, fireweed (Chamerion angustifolium), is another flammable species that has grown prolifically in the region and is unpalatable for most grazing animals.

In combination with grasses, the collection of flammable herbaceous plants and shrubs create a continuous fuel bed on unmanaged lots and bordering lands that, when dry, could carry fires to the edge of homes or into the canopies of trees. There are also silk or silver oak (Grevillea robusta) trees that are fire hazards growing within the upper stretches of Kahikinui. Adding to the wildfire threat is tinaroo glycine (Glycine wightii), which is a vine originally introduced as grazing forage and is especially prolific when left un-grazed. The vines have spread rapidly throughout the region, spreading over shrubs and the canopies of trees, eventually smothering and killing them. During dry periods, they can become a major fuel hazard, especially a connective agent between fuels. The flammable vegetation in Kahikinui can cure, or dry, very rapidly. Especially on sloped areas, these fuels can carry a wildfire much more quickly than a flat area due to convection, or the preheating of adjacent upslope fuels. According to the County Fire Authority, for every 10 degrees of slope, a fire can double its speed.

On the lower elevation stretches from Kanaio to to past Kahikinui, especially on the makai side of the highway, the dominant landscape changes to kiawe (Prosopis pallida) forests with grass/shrublands of 'ekoa or koa haole (Leucaena leucocephala), kikuyu grass, and other invasive grasses

Kiawe is a species of mesquite tree that is introduced to Hawai'i, but considered to be naturalized. Though invasive, the trees have uses including shade cover and firewood that are attractive to many residents and visitors. However, kiawe are very flammable, adapted to fire and have been a driver of canopy fires that have threatened (and burned) homes in leeward areas. 'Ekoa can transfer heat well through convection, be difficult to navigate around for ;ire suppression purposes, and its pods have been known to travel several miles during strong wind events, according to local firefighters. These pods can act as firebrands and ignite vegetation near the house or the structure directly. Together, exotic grasses, 'ekoa, and kiawe can form a chain of ladder fuels that can be an extreme fire hazard

Map 6 depicts the geographic distribution of vegetation species across the Leeward Haleakalā CWPP planning area.

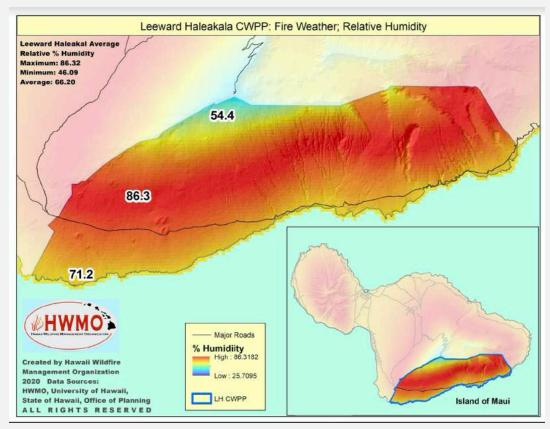

Map 6. Fuel types across the CWPP area. Note that all areas except for those that are black or green are considered high fire hazard.

#### **CLIMATE AND WEATHER**

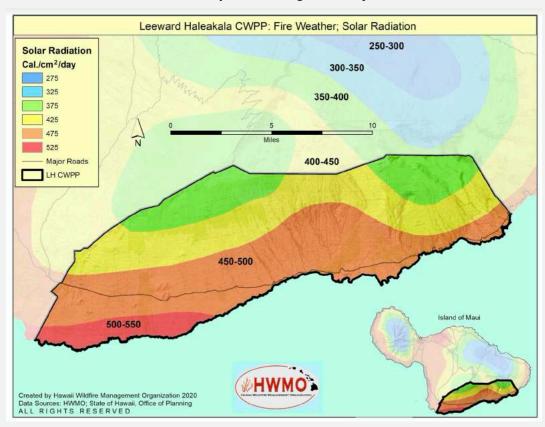

The majority of Leeward Haleakalā is dry and windy. Rainfall totals are typically at their highest from December through March due to cold fronts and kona storms during the winter, but they are highly variable each year. Being the leeward side of Haleakalā with a south-facing slope, the conditions are drier than on the north- and east-facing slopes.

The weather conditions affect the moisture content of the dead and live vegetative fuels. Dead fine fuel moisture content is highly dependent on the relative humidity and the degree of sun exposure. The lower the relative humidity (Map 8), the greater the sun exposure (map 9), the less rainfall (map 10). The greater the temperature (Map 11), the lower the fuel moisture content. Lower fuel moistures produce higher spread rates and fire intensities.

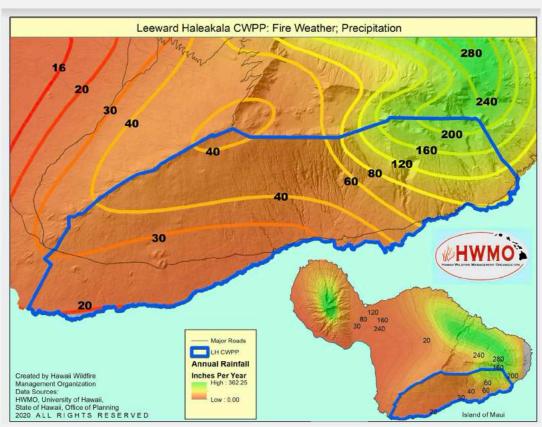

Wind speed significantly influences the rate of fire spread and fire intensity. The higher the wind speed, the greater the spread rate and intensity. Wind speeds across Leeward Haleakalā can vary dramatically throughout the year and even throughout a single day and night, depending on where the winds are coming from and what force is generating the wind, which can be daily, seasonal, or storm-driven. At the higher elevations, average wind speeds hover between 5-8mph, while at the coast, average wind speeds can exceed 20mph, with gusts 30-40mph. For these reasons, wind is a high hazard (Maps 12, 13).

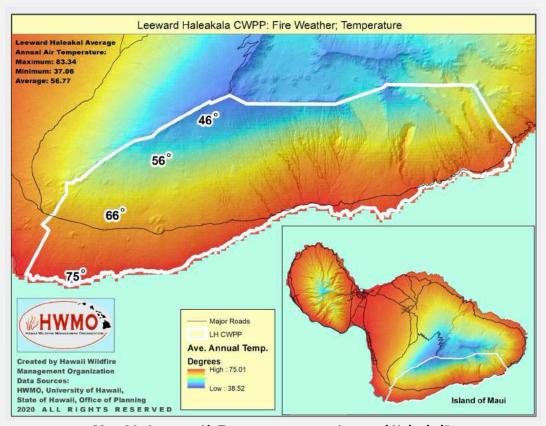

Map 8. Relative Humidity. Note that in Hawai'i, wildfires can ignite and carry across the landscape even in high humidity.

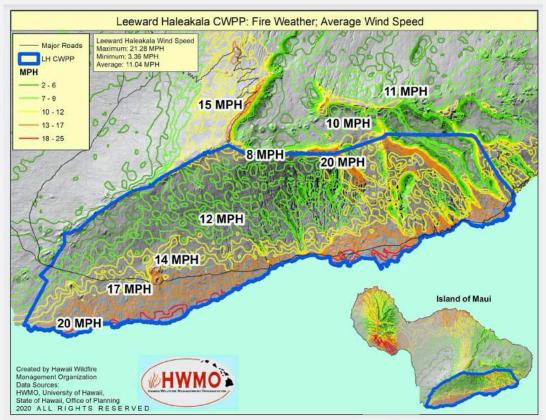

Map 9. Solar radiation. Note the high incoming solar radiation across this area. This is due to its south facing position, slope, and consequent exposure to sun throughout the day.

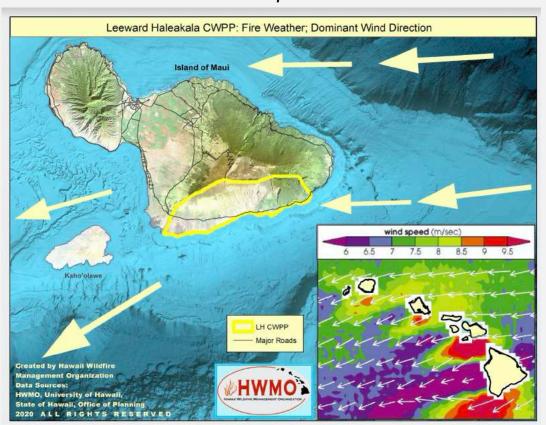

Map 10. Precipitation gradients across Leeward Haleakalā. Note that two-thirds of the region is less than 50 inches per year, even as the range stretches from less than 20 inches to over 200 inches.

Map 11. Average Air Temperature across Leeward Haleakalā.

Map 12. Average wind speeds. The area experiences land-sea breezes as well as tradewind and storm-associated wind patterns.

Map 13. Dominant wind direction. Winds are driven by the trade wind pattern with localized disruptions due to topography, seasonal anomalies, and storms, often making then erratic.

# WILDFIRE IMPACTS

Many of the community, economic, natural, and cultural resources in Leeward Haleakalā are exposed to wildfire impacts. These impacts are compounded by the fact that land-based, aquatic, and marine-based natural and cultural resources all lie within close proximity across the region.

#### IMPACTS TO NATURAL RESOURCES

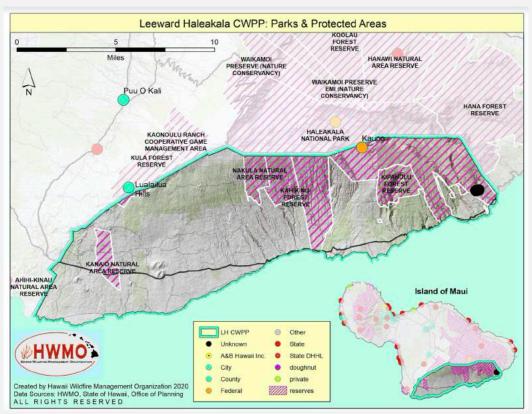

Across Hawai'i, recurrent wildfires result in the conversion of both native and nonnative forested areas to fire-adapted grasslands and shrublands – and are one of the reasons these fire-prone ecosystems are expanding in many parts of the state (this is part of the explanation for why so much of Map 6 is purple/shrublands). Wildfire is a major cause of the loss and degradation of native forest and other habitat. Most of the plant and animal species within native ecosystems in Hawai'i do not survive and/or recover from wildfires. More generally, the conversion of forest from fire and the conversion of active agriculture into fallow unmanaged weed fields increases the potential for future and larger fires by expanding the availability of fine fuels.

Wildfire also increases the potential for erosion and sediment delivery from upland to coastal and nearshore areas. The immediate loss of vegetation after a wildfire directly exposes soils to rainfall, which can dramatically increase erosion. Wildfire can also alter the physical and chemical properties of soils, making them more prone to surface run-off which can increase downstream flooding and sediment delivery. Forest conversion to grassland due to recurrent wildfires over the long-term also alters water cycling. The replacement of deep-rooted trees by shallow, matted root systems of grasses results in a higher water table and reduces the ability of rainfall to infiltrate into the soil. This causes an increase in surface runoff during rainfall events and thus increases the risk of flooding and sediment delivery downstream.

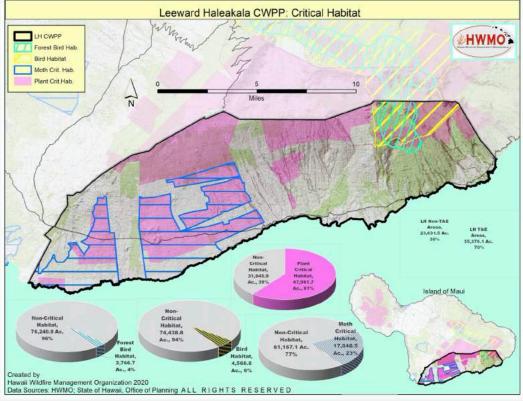

Forest loss and increased downstream sediment delivery to nearshore reefs have important implications for cultural and civic resources, as well, in terms of tourism, recreation, food resources, and cultural practices (See Map 18 for marine and coastal resource information). Sediment loading destroys reefs and impacts nearshore fisheries which are critical subsistence resources to many Maui families. Burned areas can remain closed to the public for days to months due to landslide and treefall danger, limiting access to areas for hiking, hunting, gathering plants, and tending cultural sites. Even when nearby fires do not have immediate or direct impacts on these resources, there are often indirect or longer term impacts. For example, suppression efforts, such as the use of bulldozers, can damage important landscape features and alter water flow patterns. Frequent fires also impact powerlines, communication infrastructure, and can lead to road closures - exacerbating already congested traffic areas.

Parks and protected areas lie within the CWPP boundaries (Map 14), as well as critical habitats (Map 15), and threatened and endangered plants (Map 16). The area includes several US Fish and Wildlife

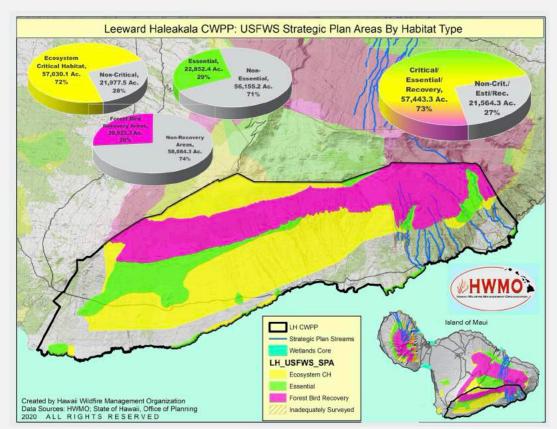

Service strategic plan designation areas (Map 17) due to the protection needs of these sensitive and important natural resources.

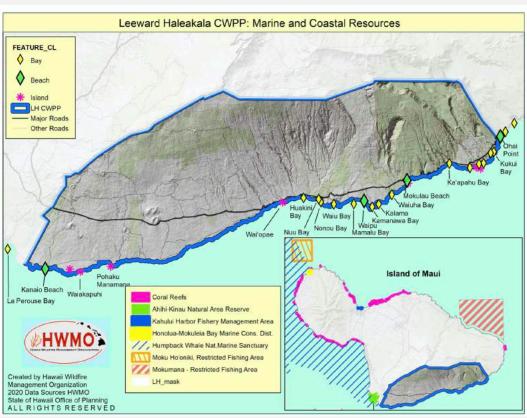

Map 14. Parks and protected areas within the Leeward Haleakalā CWPP area.

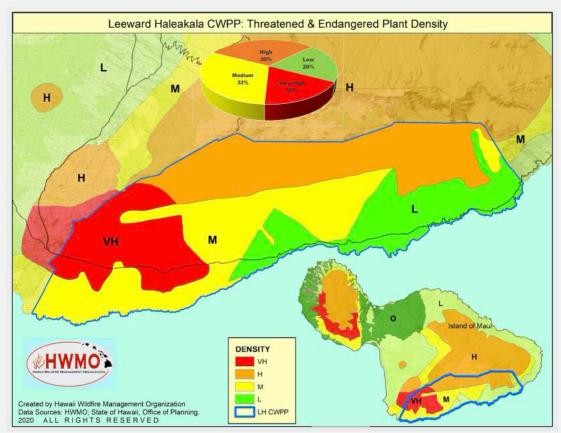

Map 15. Critical Habitat within the Leeward Haleakalā CWPP area.

Map 16. Density of Threatened and Endangered Plants within the CWPP boundaries.

Map 17. USFWS Strategic Plan areas by habitat type.

Map 18. Marine and Coastal resources and designations within the CWPP boundaries.

#### IMPACTS TO COMMUNITIES AND MUNICIPAL RESOURCES

Wildfires threaten lives, homes, and human health in several ways. Many neighborhoods have unmanaged/untended fire fuels interspersed within developed areas, promoting fire spread through communities and into surrounding areas. This creates an increased hazard to lives and homes in the area. Air quality is greatly reduced from smoke during fires and for months to years after fire due to high levels of wind-born dust. This dust is due to fire-caused changes to soil that leaves it water-repellant, and therefore easily lifted into the air.

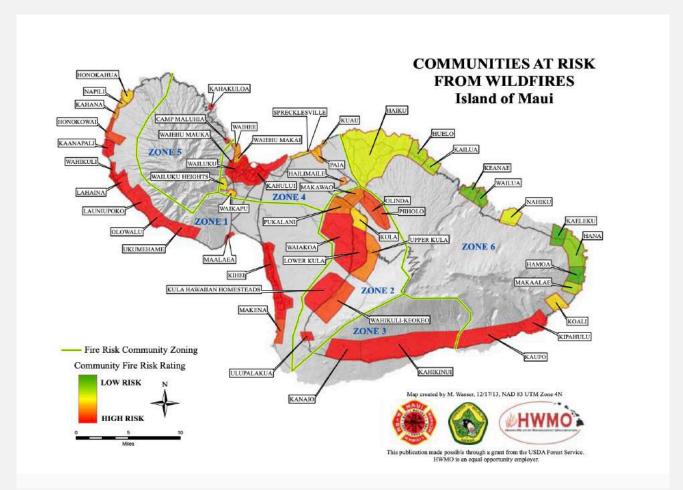

Wildfires also impact economic and municipal infrastructure and activities. Burned soil from wildfires decreases groundwater recharge, which can affect drinking water supplies. As noted above, post-fire rain events cause erosion that damages nearshore resources (coral reefs, fisheries; Map 18), which can have effects on one of the area's primary economic bases— coastal and marine-based tourism, as well as resident and visitor recreational activities. Traffic and road closures during fire events and post-fire flooding can block access routes and keep people from their homes and work, and are costly to local government. Finally, agricultural, ranching, and energy production (e.g. Auwahi Wind Farm) all face disruptions in operations during wildfire events and face the threat of catastrophic damage in the face of any future significant wildfire events.

# HAZARD ASSESSMENT

### **COMMUNITIES AT RISK FROM WILDFIRE**

For the purposes of assessing hazards and wildfire threats to resources, residential areas within the CWPP planning area were simplified into four "communities" (Map 2). The boundaries depict the areas determined by DLNR-DOFAW to have similar features in terms of wildfire hazard characteristics and have long been the boundaries used in the DLNR-DOFAW's Communities at Risk from Wildfire maps, maps created from comprehensive assessments to depict wildfire threats to developed areas and communities.

In the 2013 Communities at Risk from Wildfires map (the most recent), the communities within Leeward Haleakalā are all rated as high risk (Map 19). (Please note this map ONLY rates areas where there are residents living built structures, neighborhoods, and established communities. Gray areas on the map indicate that no humans inhabit the area, and therefore were not assessed using this method).

Map 19. Communities at Risk from Wildfires Map for Maui. Note Kanaio, Kahikinui, Kaupo, and Kipahulu are all assessed and rated as high risk.

## WILDFIRE HAZARD ASSESSMENT

The purpose of the required community risk assessment is to:

- Provide site-specific information to the public to promote wildfire awareness.
- Help identify and prioritize areas for treatment.
- Determine the highest priority uses for available financial and human resources.

The methods for this plan's community wildfire risk assessment followed the guidelines established by the HFRA. The wildfire risk assessment also follows the guidelines and requirements of the FEMA Pre-Disaster Mitigation program and the National Fire Plan. Locally, we have opted to name the effort Wildfire Hazard Assessment, rather than Wildfire Risk Assessment.

In partnership with DLNR-DOFAW, HWMO assessed the communities within Leeward Haleakalā using a process that rates 36 wildfire hazard characteristics, which have been further grouped into 5 categories. The five categories assessed for wildfire hazard are, Subdivision Hazard, Vegetation Hazard, Building Hazard, Fire Environment Hazard, and Fire Protection Hazard.

The purpose of looking in depth at each category and specific hazard is to identify the factors that put each community most at risk, and to enable mitigation action plans and activities that are targeted toward reducing risk in the factors that most need attention per area.

Table 1 provides the ratings per area per hazard category. Table 2 below provides the detailed categories assessed within each of the five categories. A weighted calculation determines the final rating for the category.

Community Area	Subdivision Hazard	Vegetation Hazard	Building Hazard	Fire Environment Hazard	Fire Protection Hazard
Kanaio	High	High	Moderate	High-Extreme	High
Kahikinui	High	High	Moderate	Extreme	High
Kaupo	Moderate	High	Moderate	Moderate-High	High
Kipahulu	Moderate	High	Moderate	Moderate	High
Entire Leeward Haleakalā CWPP Area	Moderate-High	High	Moderate	High	High

Table 1. Hazard assessment ratings per subdivision/community area within the Leeward Haleakalā CWPP planning boundaries. Priority hazards to address are shown in red.

Hazard Category	Individual Hazards Assessed Within Category
Subdivision Hazard	Fire Service Access Home Setbacks Ingress/Egress Private/Landowner Firewise Landscaping and Defensible Space Proximity of Subdivision to Wildland Areas All Season Road Condition Road Maintenance Road Width Street Signs Structure Density Unmanaged, Untended, Undeveloped Land
Vegetation Hazard	Defensible Space: Fuels Reduction Around Homes & Structures Fuel Loading Fuel Structure & Arrangement Proximity of Flammable Fuels Around Subdivision Vegetation Within 300' of Homes
Building Hazard	Siding/Soffits Roofing Assembly Structural Ignitability Under-Skirting Around Decks, Lanai, Post & Pier Structures Utilities Placement: Gas & Electric
Fire Environment Hazard	Average Rainfall Prevailing Wind Speeds & Direction Slope Topographic Features that Adversely Affect Wildland Fire Behavior Seasonal or Periodic High Hazard Conditions Ignition Risk
Fire Protection Hazard	Response Time Community Planning Practices & Ordinances Community Fire Safe Efforts & Programs Already in Place Fire Department Structural Training & Expertise Local Emergency Operations Group or Citizen Group Proximity to Fire Stations Water Source Availability Wildland Fire Response Capacity of Initial Response Agency Interagency Cooperation

Table 2. Overview of hazard assessment categories and the individual hazards that comprise them.

# **EMERGENCY RESPONSE**

#### FIRE SUPPRESSION CAPABILITIES AND RESOURCES

Maui Fire Department resources and equipment are spread across the entire county and are made available when needed if they are not already in use. MFD has 14 fire stations across the County of Maui. There are 10 fire stations on the Island of Maui, none of which are within the CWPP planning area. The closest fire station to the east side is located in Hana. Wailea to the west and Makawao to the north are the next closest stations.

Initial response to the majority of wildfires (as well as all medical and other emergencies) is the responsibility of MFD. DLNR-DOFAW responds to wildfire events on state lands and provides additional wildland firefighting assistance when state lands are threatened and/or mutual aid agreements are invoked.

Map 20 was developed by DLNR-DOFAW and demonstrates the independent and shared response zones of each agency in the CWPP planning area.

Map 20. Fire Response Zones. Indicates areas where fires are suppressed by Maui Fire Department, DLNR-DOFAW, National Park Service/Federal, or a combination.

## **EMERGENCY MANAGEMENT DOCUMENTS AND OTHER PLANS**

The CWPP is non-regulatory and cooperative in nature. The plan provides (1) a foundation for increased communication, coordination and collaboration among agencies and the public, (2) identification and prioritization of areas for hazardous fuel reduction projects and wildfire mitigation actions, and (3) assistance meeting federal and state planning requirements and qualifying for assistance programs.13 The CWPP is designed to work in conjunction with other county and state plans, operational policies, assessments, and programs, etc., including but not limited to:

# **County of Maui:**

County of Maui Drought Mitigation Strategies

County of Maui Multi-Hazard Mitigation Plan and Hazard Mitigation Plan Update (2015)

County of Maui Water Use and Development Plan Draft

Maui Island Plan

#### State of Hawai'i:

State Drought Plan (2017)
State of Hawai'i Multi-Hazard Mitigation Plan
State Division of Forestry and Wildlife Operational Policy for Wildfire Control
DLNR Forest Action Plan (2016)

## **MULTIPLE-AGENCY AGREEMENTS**

Memoranda of Agreement, Memoranda of Understanding, and/or Mutual Aid Agreements are in place among MFD, DLNR-DOFAW, and Department of Interior (DOI). These agreements identify the suppression responsibilities of each party as well as other fire management activities such as joint participation in prevention, training, and equipment acquisition. Fire response zones are delineated on Map 20.

In the County of Maui, there is a coordinating group established to deal with and discuss wildfire issues, mitigation, and response. Federal, state, and local fire agencies have organized into the Maui Wildfire Coordinating Group coordinates the programs of the participating wildland fire agencies on Maui and provides a forum for leadership, cooperation and the exchange of information. It also improves procedures to rapidly provide the most effective response to wildfires in the island. In coordination with County of Maui Civil Defense Agency, drought and other fire-hazard conditions are constantly monitored and actions such as burning bans and closures are instituted when needed. The public is informed of these restrictions by radio announcements and newspaper notices.

Several local/regional fire task forces also exist across Maui County to collaboratively discuss, coordinate, and implement on-the-ground wildfire mitigation projects. Comprised of fire and emergency response agencies, as well as additional local partners, organizations, and community

representatives, these task forces work on issues and goals specific to their focal areas. The Leeward Haleakalā Fire Task Force (LHFTF) is one such coordinating group, and was a primary partnership in the development of this CWPP.

#### **EVACUATION PROTOCOLS AND NEEDS**

Evacuation protocols for neighborhoods and areas in Leeward Haleakalā have been determined for natural hazards such as tsunamis, and can be found in the documents listed below. However, fire safety zones for all neighborhoods and areas of Leeward Haleakalā are yet to be determined, and are a priority action determined by the public as part of this CWPP process.

The following resources are available for disaster preparedness information:

- County of Maui Civil Defense Agency Website
- Disaster Preparedness for Maui County: A Citizen's Guide
- Hurricane Information and Tips
- <u>Tsunami maps information, and tips</u>

#### STATE FIRE CODE

The Hawai'i State Fire Code is adopted by the State of Hawai'i according to Chapter 132 of the Hawai'i Revised Statutes, with modifications to the 2018 National Fire Protection Association 1 Fire Code. The Fire Code of the County of Maui is adopted with modifications from the State Fire Code.

The State Fire Code that took effect most recently (January 19, 2021) can be found at: <a href="https://labor.hawaii.gov/wp-content/uploads/2021/02/2018-NFPA-1-Amendments-Jan\_20\_21.pdf">https://labor.hawaii.gov/wp-content/uploads/2021/02/2018-NFPA-1-Amendments-Jan\_20\_21.pdf</a>

All county fire departments have two years from this date to adopt the State Fire Code as their county fire code and may amend this code as it applies to their jurisdiction.

## WILDFIRE PREVENTION

Several agencies are working both independently and collaboratively on wildfire prevention activities in the North Shore CWPP area.

MFD Fire Prevention Bureau The Fire Prevention Bureau works to abate fire and life-safety hazards before they can cause injury and property damage. Focal services include fire education programs to increase the public's awareness of fire safety, including an annual fire safety program for Maui County schools and the Smoke Alarm Maui Program. Other focal services include fire investigation, reviewing building plans and permits for fire safety, and issuing several special permits.

<u>DLNR-DOFAW</u> is statutorily mandated to take measures for the prevention of wildland fires within DLNR-DOFAW managed lands and to cooperate with county and federal fire agencies in developing plans and programs for prevention assistance of wildfires on additional lands. DLNR-DOFAW is involved with and committed to the following community risk reduction initiatives: supporting the development and action plans of Community Wildfire Protection Plans, locally administering the U.S.

Forest Service Wildland-Urban Interface grant program, serving as the state liaison for the Firewise USA<sup>TM</sup> community risk reduction program (in partnership with HWMO), and administering State Legislature Grant-In-Aid awards given to local organizations who are working on wildfire-related projects (in 2021, these include HWMO and Ka'ala Farm, Inc.)

**HWMO** is a nonprofit organization founded in 2000 to focus on wildfire prevention and risk reduction activities. The organization serves as a hub of wildfire information, mitigation, and project assistance across Hawai'i. HWMO supplements and complements agency wildfire efforts, aims to meet community hazard reduction needs, and coordinates/leads multi-jurisdictional and multipartner wildfire projects. HWMO develops and offers educational wildfire prevention, preparedness, and planning workshops for diverse audiences and stakeholder groups; leads the development of Community Wildfire Protection Plans and fire management plans; serves as the community liaison for the Firewise USA program (in partnership with DLNR-DOFAW), assisting communities with their applications, renewals, and offering learning and connecting opportunities among the 15 Firewiserecognized communities across Hawai'i; leads multi-partner wildfire collaboration projects and groups; and implements cross-boundary fuels management projects. HWMO also collaborates closely with the Cohesive Wildland Fire Management Strategy, Western Region and the Fire Adapted Communities network, liaising with and sharing best practices between Hawai'i and national partners. HWMO works together with the University of Hawai'i to implement the Pacific Fire Exchange project, a fire science communication project that develops, collates, and shares best available wildfire information on behalf of a broad partnership that includes DLNR-DOFAW, USDA Forest Service, County Fire Departments, and other forestry and fire entities.

#### University of Hawai'i at Mānoa College of Tropical Agricultural and Human Resources (UHM-

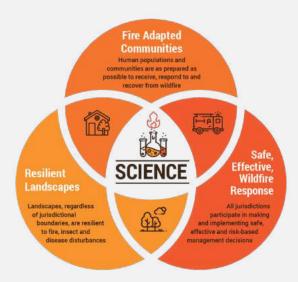

**CTAHR)** has several researchers, extension specialists, and some graduate students who synthesize and develop new information on topics pertaining to wildfire. Faculty expertise includes range management, forestry, ecology, social science, and fire science which has contributed to a range of wildfire-related products such as fuels data, maps, risk models, and other information. HWMO and UHM-CTAHR Cooperative Extension partner to implement the Pacific Fire Exchange project (PFX). PFX is a fire science communication project that works to improve the availability and sharing of fire science relevant to the Pacific Island region to support and inform the wildfire mitigation work of land managers and emergency responders.

Together, **all of the above entities** participate in and support the multi-agency statewide <u>Wildfire</u> and <u>Drought Lookout!</u> awareness and preparedness campaign each year; conduct wildfire hazard assessments (often in partnership with each other); and collaborate whenever possible to protect life, property, and natural resources from the impacts of wildfire.

## WILDFIRE ACTION PRIORITIES

# NATIONAL COHESIVE WILDLAND FIRE MANAGEMENT STRATEGY

The National Cohesive Wildland Fire Management Strategy (subsequently referred to as Cohesive Strategy) encourages communities to develop a dynamic approach to planning for, responding to, and recovering from wildland fires. It provides a framework for wildfire-related discussion, efforts, and goals across the United States. The overarching national strategy is further divided into three regions for tighter collaboration and coordination in each area. Hawai'i falls into the Western Region. The three categories are: Fire-Adapted Communities; Resilient Landscapes, and Safe and Effective Wildfire Response. Considering each and addressing all three is necessary for effective wildfire preparedness and protection.

Public and government agency participants identified hazard reduction priorities for Leeward Haleakalā within the Cohesive Strategy categories, after first having an opportunity to learn more about each category's wildfire preparedness and safety challenges and goals. This participant input was collected via two live virtual workshops and a web-based survey. The live workshops were facilitated toward the discussion and recording of wildfire-related concerns, priorities, and recommended actions per category. Additional focused conversations were also facilitated per residential area, to capture each area's unique wildfire issues and next-step priorities. A web-based survey followed the format of the live workshops, asking participants who were unable to attend the workshops for their highest priority wildfire-related concerns per category, along with suggested actions for addressing those concerns.

Both live-workshop and web-survey input has been combined and integrated into the discussion and priorities provided below for addressing wildfire in Leeward Haleakalā. An independent summary of data from the web-based survey is provided in Appendix B.

#### RESILIENT LANDSCAPES

#### **DISCUSSION**

Across Leeward Haleakalā, vegetation is dense, dry, and very flammable. Workshop participants discussed the need for sustained maintenance of fuels and an increased capacity to manage vegetation for the long-term. A critical lack of water impacts grazing, agriculture and farming, and firefighting. The area is remote, with long distances to travel along a lone highway, impacting fuels management, firefighting response time, and creating a challenging combination of illegal dumping and the abandonment of cars without consistent enforcement or regulation.

#### **GOALS**

Landscapes (natural and culture resources) across all jurisdictions and land ownerships must be supported to become resilient to fire-related disturbances in accordance with management objectives. This includes the following:

- 1. Risk of wildfire occurring and impacting lands and waters is diminished.
- 2. Pre-fire hazards are managed and mitigated (reducing ignitions/managing vegetative fuels).
- 3. Sensitive resources are minimally or not damaged during wildfire events by the firefighting effort.
- 4. Post-fire recovery, rehabilitation, and restoration are supported.

#### **ACTION PRIORITIES\***

- Implement fuel reduction projects to reduce ignition and spread, to include all methods where appropriate: mechanical, chemical, animal, by-hand, etc.
- Mitigate roadside/highways fuels, especially by grazing.
- Support increased grazing for sustained fuels management.
- Pursue projects that increase/improve water availability for grazing, farming, and firefighting use.
- Add animal husbandry projects/operations in strategic places, such as Kahikinui. Projects can include goats, fencing, ranching, etc.
- Reach out to community about fuels management needs, explaining initial commitment vs. sustainability and maintenance; establish long-term agreements.
- Pursue funding for DLNR-DOFAW firefighting teams that do fuels management and other fire mitigation/ pre-suppression work (also listed in Wildfire Response category).
- Define, determine, maintain and prioritize fuelbreaks, especially those made during fires.
- Develop clear corridors that also serve as firefighting access.
- Establish green breaks where appropriate.
- Conduct collaborative planning and mapping of firefighting resources, infrastructure, sensitive areas, water resources, access, fuelbreaks, etc. Develop a fire management plan, which includes all these aspects.
- \* The majority of action priorities in the resilient landscapes category address the treatment of hazardous fuels. This is a major priority for Leeward Haleakalā.

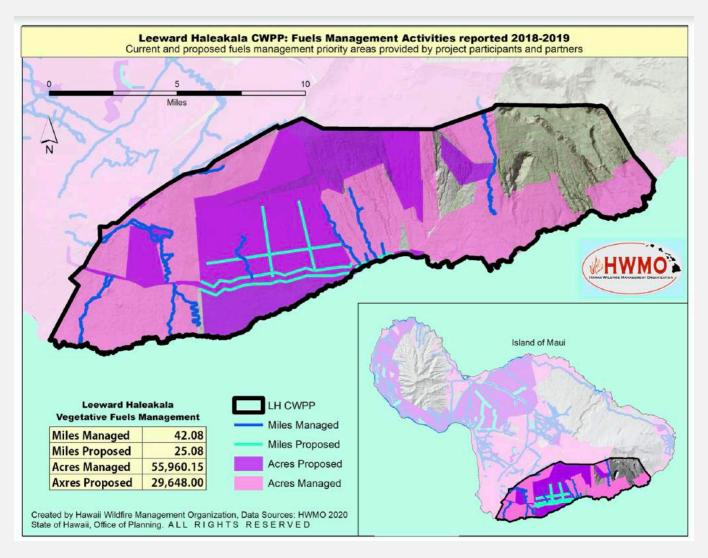

Additionally, a CWPP must identify and prioritize areas for hazardous fuel reduction treatments and recommend the types and methods of treatment that will protect one or more at-risk communities and essential infrastructure. Based on the fuel hazard ratings acquired during the hazard assessment, recommendations for the type and method of vegetative fuels reduction treatments for high fuel hazard areas are listed in Table 3 below:

Resource, Structure, or Value at Risk	Fuel Hazard Rating	Type of Treatment
Mauka forest lands, parks, reserves	High or Extreme if unmanaged and weather conditions dry	Mechanical, hand labor, chemical, fuels conversion, animals if strategically managed
Gentle sloping grasslands and scrublands	High or Extreme if unmanaged and weather conditions dry	Mechanical, hand labor, chemical, fuels conversion, animals if strategically managed
Homes, structures with large lots or heavy vegetation, and historical sites	Moderate to Extreme	Firewise strategies around the home/ structure ignition zones. Reduce fuel along property boundaries and roadsides. Weedwhip, hand-pull, mow, grazing, herbicide, trim branches. Clear debris piles. Convert fuels to drought-tolerant, fire- resistant (preferably native) plants. Reduce ladder fuels. Complement vegetation management strategies with home hardening (replace ignitable/burnable materials with non combustible materials).
Roadsides	Moderate to Extreme (depending on location and weather conditions)	Conduct roadside fuels treatments at frequency that matches fuel growth (keep low), maximize width of roadside reduction areas. Develop a grazing corridor/buffer for long-term fuels management. Convert roadside fuels to fire-resistant plants that require little or no maintenance and are less ignitable.
Unmaintained Agricultural lands	Moderate to Extreme (depending on location and weather conditions)	Mechanical, animal, chemical, reestablish active agriculture.

Table 3(above). Hazardous Fuels Treatments

In 2018, land managers across Hawai'i contributed to a fuels management mapping project, wherein those who chose to participate indicated areas that have some level of active fuels management occurring. The project was coordinated by HWMO, also the coordinator and writer of this CWPP. Participants in the mapping project also indicated areas additional areas they believe would be necessary to address with fuels management activities to achieve optimal fire mitigation. While participation was voluntary, and therefore, not a complete representation of all that is occurring and

needed in Leeward Haleakalā, it does provide a starting point for discussion and fuels management project planning (Map 21).

Map 21. 2018-19 Voluntary reporting of current and proposed/needed hazardous fuels management activities.

#### FIRE ADAPTED COMMUNITIES

#### **DISCUSSION**

Despite frequent fires, many residents across Leeward Haleakalā are not as informed, engaged, or active in wildfire preparedness and hazard reduction as is necessary for optimal safety and prevention. Community outreach and education programs, technical assistance, opportunities, and capacity-building are needed. Abandoned vehicles and rubbish are building up in remote areas. Many areas are not designed for safe and effective firefighting.

#### **GOALS**

Human populations and infrastructure must be able to withstand wildfires without loss of life or property. Communities must become as prepared as possible to endure, respond to, and recover

from wildland fire. Everyone must knows they play a role in prevention and safety and must do their part. This includes the following:

- 1. Roles and responsibilities established in all jurisdictions and across al communities and landownership for mitigating fire threats and impacts.
- 2. People accept and act upon their responsibility to prepare families and properties.
- 3. Risk to community areas and resources, including municipal resources, is diminished.
- 4. Effectiveness of activities is monitored and shared and is relevant to local mitigation and other plans.

#### **ACTION PRIORITIES**

- Support residential/homeowner actions via:
  - Outreach and education
  - Firewise programming
  - Other safety campaigns
  - Technical assistance and resources (chipper days, etc.)
  - Grants to help build capacity (equipment and tools)
  - Programs that build community awareness, group mentality/culture, and attitudes toward wildfire prevention and preparedness
- Improve enforcement to reduce deliberate ignitions and abandoned vehicles:
  - Increase and maintain substantial cooperative and collective action by agencies for enforcement.
  - Consider seasonal increases in enforcement and increased presences of DOCARE and other relevant agencies.
  - Explore options for infrastructure to be based in more remote areas.
- Improve signage at access points.
- Explore the potential for community/volunteer firefighting (also in Wildfire Response section).
- Improve ingress and egress for firefighting and evacuation (also in Wildfire Response section).
  - Ingress and egress
  - Wider roads
  - Adequate turnarounds
  - Staging areas
  - Road and fuelbreak signs
- Provide information, and pursue outreach and eduction programs for residents and area managers to treat structural ignitability of homes and buildings.\*

<sup>\*</sup> Strategies for treating structural and home/yard ignitability in Hawai'i have been established through the Hawai'i version of the Ready, Set, Go! Action guide. This informational resource is included as Appendix A of this document and should be used by residents in Leeward Haleakalā to treat structural, home, and yard ignitability.

#### SAFE AND EFFECTIVE WILDFIRE RESPONSE

#### **DISCUSSION**

Due to the remoteness of the area and the limited infrastructure throughout, many residential areas are poorly set up for wildfire response. The most pressing issue is a lack of water, but long response times due to distance, ingress/egress issues, inadequate road signage for location homes, and an increasing number of lots being developed contribute to firefighting challenges.

#### **GOALS**

All jurisdictions will continuously work together toward making and implementing safe, effective, efficient risk-based wildfire management decisions to ensure that:

- 1. Injuries and loss of life for public and firefighters is diminished.
- 2. Adequate infrastructure and capacity: water, access, equipment, training.
- 3. Pre-fire multi-jurisdictional planning occurs.
- 4. Response, esp. when jurisdiction is shared, is efficient and effective.

#### **ACTION PRIORITIES**

- Increase firefighting capacity, including personnel/staffing and additional fire stations in remote/rural areas.
- DLNR-DOFAW pursue the development of a team that does brush abatement as well as suppression.
- Advocate and work toward increased firefighting budgets.
- Develop better systems for mutual aid reimbursements among agencies.
- Increase communication between Kahikinui and DLNR-DOFAW re firefighting budgets .
- Create designated points of contact for each landowner for keys and access, establish lockboxes where appropriate.
- Establish additional water resources.
- Restore and reline existing water infrastructure.
- Install fuel stations for helicopters in strategic areas to reduce response time and decrease travel time required for refueling of helicopters.
- Consider/explore radio communications for community leads/points of contact.
- Improve infrastructure design and access for firefighting and evacuation (also in Communities section):
  - Ingress and egress
  - Wider roads
  - Adequate turnarounds

- Staging areas
- Road and fuelbreak signs
- Conduct collaborative planning and mapping of firefighting resources, infrastructure, sensitive areas, water resources, access, fuelbreaks, etc. Develop a fire management plan, which includes all these aspects. (Also in Resilient Landscapes section).
- Include more people, including residents and community members in fire response planning, coordination, and communications.

#### **ACTION PRIORITIES PER AREA**

#### **KANAIO**

- Engage and support the community to coordinate the development of a community association.
- Work to organize a hui to establish a culture of being proactive.
- Work on community development to better understand and address social issues that add to fire and safety hazards.
- Protect and engage people via safety programs and working directly with residents.
- Increase enforcement, rules, regulations, and ordinances.
- Enhance county program for abandoned vehicles.
- Address road labeling to improve locating people during emergencies.
- Update maps to show roads, fuelbreaks, houses.
- Install signage to navigate roads during emergencies.
- Establish water resources.
- Establish and/or improve water system:
  - Hydrant system
  - Storage tank to feed hydrant system
  - Improve, maintain, and repair existing water lines and water supply
- Make a task force planning session to pursue these projects and build support:
  - Keep these needs and projects active with elected officials through coordinated follow-up and outreach at least every 3 months, invite them to task force meetings
  - Apply for GIA or CIP funding to develop water infrastructure
  - Approach County for water to serve Kanaio and firefighting
  - Explore and pursue CARES Act funding for these projects

#### KAUPO-KIPAHULU

- Prioritize establishing and improving the water situation.
  - Work on reservoirs
  - Work on issue of water not being a public water system
  - Reline reservoirs and add a second smaller reservoir
- Map out where helicopter can land
- Establish a firefighting staging area, and over time, how to get a fire station in the area.
- Improve community awareness via outreach and education:
  - Firewise
  - Hunter campaigns
  - Campfire safety workshops
  - Fire extinguisher training
  - Equipment safety
  - Passive information stations (that community owns/sustains)
- Improve road maintenance, access, and signage for firefighters.
- Explore how conservation crews could help with reporting fire or responding.

- Establish practice of letting MFD/MPD know when crews are in high fire danger areas and out of communication range.
- Establish mechanisms (dumpsite or other) for dumping waste of different kinds that are currently limited:
  - Household trash (dump station)
  - Green waste (Hold chipper days or chipper/veg waste station for community)
  - Abandoned vehicles and other equipment

#### **KAHIKINUI**

- Improve access to water and water infrastructure:
  - Conduct planning for water resources.
  - Install and/or reactivate reservoirs.
  - Research options for water resources to improve water availability for both homesteaders and firefighting.
  - Add water resources and infrastructure to support grazing.
- Improve firefighting access, safety, and response operations:
  - Widen access road from main highway to community center.
  - Increase width of the corridor (50-100ft).
  - GPS newly paved roads, Jeep/Fuelbreak Road.
  - Install road signage for streets and fuel break roads.
  - GPS and map out infrastructure, including water sources, roads, gates.
  - Establish system for locks and points of contact.
  - Explore options and establish community access to secondary egress for emergencies.
  - Improve forest access roads for safe evacuation from forest.
- Increase and improve community outreach and education:
  - Provide outreach and training programs regarding fire mitigation strategies and to build capacity to address immediate needs, implement stop-gap measures, and establish a longterm vision and action plan.
- Create firebreak system that can be sustainably maintained, prioritizing fire suppression tactics, firefighter safety, and long-term fuels management capacity (by community, agencies, and all responsible entities):
  - Re-establish dozer breaker (regrade, resurface).
  - Coordinate ongoing maintenance for breaks.
  - Create grazing corridors and water/infrastructure for long-term grazing.
  - Conduct regular roadside fuels management via reduction, grazing, and/or green-breaks (as secondary buffer and to reduce regrowth).
  - Establish additional firebreaks that are compartmentalized and manageable.
  - Increase passive fuels reduction.
  - Install fencing along community boundaries to control wild cattle and aid fuels management.
  - Create a strategic grazing area around the community.
- Establish safe, enforced, and less hazardous means for green waste disposal.

#### CWPP IMPLEMENTATION AND MAINTENANCE

HFRA requires that the MFD, County of Maui Civil Defense Agency, and DLNR-DOFAW all agree on the final contents of the Leeward Haleakalā CWPP. The plan is signed by each agency in order to meet HFRA and FEMA requirements.

Across the state and country, there is a changing understanding and paradigm related to wildfire: reducing wildfire occurrence and impacts takes the participation and action of all who live and work in an area. There is a role for everyone to play to reduce risk, enhance preparedness, and ensure the safety and integrity of our community and natural resources. Firefighting is the last line of defense, with much to also be done ahead of time to reduce fire's ability to ignite and spread, and to prepare homes and people to withstand wildfire.

It is for these reasons that the Leeward Haleakalā CWPP was developed: to collaborate, co-determine priorities, and encourage participation by all parties. **Because of the non-regulatory nature of the CWPP**, the relevance and effectiveness of the North Shore CWPP will rely heavily upon initiative and involvement by individuals, groups, organizations, and government in the North Shore area.

Participants in the Leeward Haleakalā Fire Task Force (LHFTF) and HWMO intend to provide technical support, identify and coordinate funding when possible, and serve as a centralized resource for wildfire risk reduction efforts in Leeward Haleakalā. Together, representatives will identify sources of funding for projects, document the successes and lessons learned from those projects, and evaluate and update the CWPP as needed and as possible. Area residents are urged to contribute time and effort toward creating defensible space, reducing structural ignitability, and working at the community level to initiate and maintain wildfire protection projects. Decision makers and elected officials are encouraged to support these efforts through appropriate budgets and policies.

Additionally, as Hawai'i's community liaison to the national Firewise program, and in partnership with MFD and DLNR-DOFAW, HWMO will work with any community in Leeward Haleakalā that is interested in undergoing the Firewise USA® recognition process. This includes forming a local Firewise committee and action team, completing a comprehensive hazard assessment specific to their subdivision, and sustaining neighborhood-level action toward risk reduction. Kahikinui is already a recognized Firewise USA® community, and has kept its recognized status through successful mitigation efforts for several years now, with no anticipated change in that effort. There is a statewide network of such communities available for inspiration, the sharing lessons learned, and next-level learning.

Many Leeward Haleakalā CWPP action items will require continuing support for wildfire risk mitigation projects. This will involve actively pursuing funding for projects, staying informed and in contact with one another, and updating this CWPP regularly so that it remains a "living" document. All who have been involved in the development of this CWPP are committed to building community awareness of these issues so that Leeward Haleakalā will continue to make progress toward the goals of having Fire Adapted Communities, Resilient Landscapes, and Safe and Effective Wildfire Response in Leeward Haleakalā.

# READY, SET, GO!

## **Wildland Fire Action Guide**

Saving Lives and Property
Through Advanced Planning

he fire season is now a year-round reality in many areas across the Hawaiian Islands, requiring firefighters and residents to be on heightened alert for the threat of wildland fire.

Each year, wildland fires consume hundreds of homes across the nation in the Wildland-Urban Interface (WUI), and Hawaii is at a similar risk. Studies show that as many as 80 percent of the homes lost to wildland fires could have been saved if their owners had only followed a few simple fire-safe practices. In addition, wildland fire related deaths occur because people wait too long to leave their home.

In the event of a wildland fire, our first responders take every precaution to help protect you and your property. However, the reality is that in a major wildland fire event, there will simply not be enough fire resources or firefighters to defend every home.

Successfully preparing for a wildland fire enables you to proactively take personal responsibility for protecting yourself, your family and your property. In this Action Guide, we hope to provide the tips and tools you need to prepare for a wildland fire threat (Ready), have situational awareness when a fire starts (Set), and to act early (Go!).

The Ready, Set, Go! Program works in complimentary and collaborative fashion with the Firewise USA® program and other existing wildland fire public education efforts. Utilizing firefighters and local wildland fire prevention expertise, it amplifies their messages to individuals to better achieve the common goal of wildland fire preparedness.

Many residents have built homes and landscaped without fully understanding the impact a fire can have on them and few have adequately prepared their families for a quick evacuation.

It's not a question of **if** but **when** the next major wildland fire will occur. Through advanced planning, understanding and preparation, we can all be partners in the wildland fire solution. We hope you find the tips in the following pages helpful in creating heightened awareness and a more fire-safe environment for you, your family and firefighters.

This publication was produced by Hawaii Wildfire Management Organization (HWMO), made possible through a grant from the USDA Forest Service and with the help of HWMO's partners from Hawaii Department of Land and Natural Resources - Division of Forestry and Wildlife, College of Tropical Agriculture and Human Resources of the University of Hawaii at Manoa, Hawaii Fire Department, Honolulu Fire Department, and Maui Fire Department, and the Pacific Fire Exchange project, in a cooperative for with the Unternational Association of Fire Chiefs. HWMO is an equal opportunity employer. The national RSG! Program is managed by the International Association of Fire Chiefs, funded by the United States Department of Agriculture Forest Service, the United States Department of the Interior, with partner support from the United States Fire Administration, Firewise USA, and the Insurance Institute for Business and Home Safety. For more information on the RSG! Program, please visit www.wildlandfireRSG.org. This Hawaii version of the RSG Action Plan is being funded in part by The Cooperative Fire Program of the U.S. Forest Service, Department of Agriculture, Region 5. In accordance with Federal law and U.S. Department of Agriculture policy, this institution is prohibited from discriminating on the basis of race, color, national origin, sex, age, or disability. (Not all prohibited bases apply to all programs.) To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 1400 Independence Avenue, SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.

# Living in the Wildland Urban Interface and the Ember Zone

Ready, Set, Go! Begins with a House That Firefighters Can Defend

#### **Defensible Space Works!**

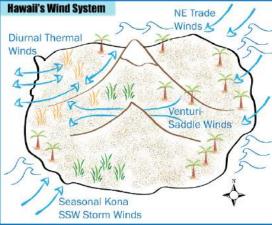

If you live next to a natural area, the Wildland Urban Interface, you should provide firefighters with the defensible space they need to protect your home. The buffer zone you create by removing weeds, brush and other vegetation helps keep the fire away from your home and reduces the risk from flying embers. Firewise Communities and other wildland fire preparedness education programs provide valuable guidance on property enhancements.

## Not Only the Homes on the Wildland Boundary are at Risk

A home within one mile of a natural area is in the Ember Zone. Wind-driven embers can attack your home. You and your home must be prepared well before a fire occurs. Ember fires can destroy homes or neighborhoods far from the actual flame front of the wildland fire. These threats are amplified in Hawaii due to the culmination of thermal, saddle, storm, and trade winds that create a complex system of strong, erratic winds (see diagram on right).

Fire is wind-driven. Know your wind-related risks

# Hawaii's Growing Wildland Fire Problem

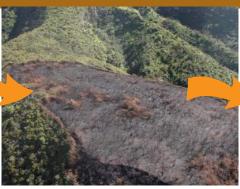

And Why We Should Be Concerned

Traditionally, Hawaii ecosystems existed with a very limited presence of wildland fire. However, as climate conditions and land uses have changed over recent time, non-native, fire-adapted vegetation have rapidly spread through our wildland landscapes and toward community boundaries. In addition, communities are expanding further into fire-prone areas, increasing the risk of wildland fires that threaten natural resources, including native habitats, and people's lives and homes.

## **Impacts on Natural Resources**

Invasive vegetation such as guinea and fountain grass spread easily and rapidly.

These plants also ignite easily. After the fire, they re-sprout and out-compete native plants, spreading over a larger area than before.

All it takes is another spark and the same area will burn hotter, more intensely, and over a larger area than before. This creates a vicious fire cycle.

Wildland fire, fueled by the build-up of dry vegetation and driven by a complex system of hot dry winds, are extremely difficult, expensive, and dangerous to control. Hawaii's wide diversity of challenging terrains add to the challenge for firefighters.

#### **Did You Know?**

26% of the state land cover is nonnative grassland.
These grasses are fireprone and spread more and more with each fire.

#### Mauka Fires Affect Makai Health and Safety

Large fires destroy vegetation that help hold down soil. Heavy winds can lift the soil and create dust storms that impact air quality and human health.

In addition, Hawaii's high-intensity rain events can sweep away soil through erosion, runoff and land-slides.

Rivers and streams carry the debris and sediment into the ocean polluting coral reefs and negatively affecting sea life. This adversely affects commerce such as fishing and marine/coastal-based tourism.

## **Impacts on People & Communities**

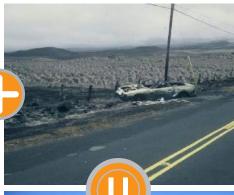

Towns and cities expanding outwardly into formerly undeveloped areas...

and large areas of fallow, invasive, or un-managed vegetation...

and a steady increase in human ignition sources via human error and intention...

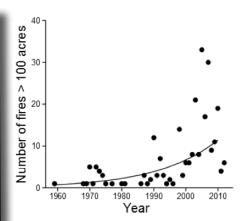

#### Did You Know?

Hawaii experiences more than 1,000 wildfires per year, burning an average of 20,000-40,000 acres each year.

On average, every island has at least one 1,000 acre fire every year.

Wildfires in Hawaii are increasing in size, frequency, and impacts.

Every island and every area (windward, leeward, mauka, makai) can be at risk under the right conditions, mainly during periods of dry weather and high winds.

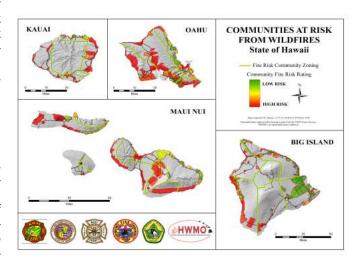

...are increasing the size, frequency, and intensity of fires across all of the islands on both wet and dry sides.

## **Future Outlook**

Climate change is increasing the length and frequency of drought periods, creating drier conditions. Scientists predict these trends will continue and even worsen, which will result in larger fires that are more severe and intense. As more areas become drier, they will become more prone to wildfire. If your area is currently low risk in the map below, it likely is still at risk during very dry periods. Under certain conditions, such as dry periods and heavy winds, anywhere can burn, and we are seeing that occur. As a result, it's best if you take action now, rather than later, when it may be too late.

The Communities at Risk from Wildfires Map (on right) was the result of an effort that looked at 36 hazard characteristics that contribute to wildfire risk for neighborhoods and communities (gray areas were NOT assessed). Many of Hawaii's communities are at moderate to high risk of wildfire for reasons ranging from climate to lack of water to lack of community awareness and action. Many of the challenges are ones we can address with collaborative action.

#### How You Can Make a Difference

We need to create **resilient landscapes and communities** across Hawaii. You can play a significant role by increasing resilience in and around your own home and preparing your family for a potential wildland fire event. Use the following pages as a guideline.

## What is Defensible Space?

Defensible space is the required space between structures and the wildland area that, under normal conditions, creates a sufficient buffer to slow or halt the spread of wildfire to a structure. It protects the home from igniting due to direct flame or radiant heat. Defensible space is essential for structure survivability during wildland fire conditions. For more information about defensible space zones and preparedness techniques within each, visit the Firewise USA® website, www.firewise.org.

#### **ZONE ONE**

Zone One extends 30 feet out from buildings, structures, decks, etc.

- Remove all dead or dying vegetation.
- Remove "ladder fuels" (low-level vegetation that allows the fire to spread from the ground to the tree canopy). Create at least 6 feet of separation between low-level vegetation and tree branches. This can be done by reducing the height of low-level vegetation and/or trimming low tree branches.
- Create "fire-free" area within 5 feet of home, using non-flammable landscaping materials and/or high-moisture content, drought-resistant vegetation.
- Trim tree canopies regularly to keep their branches a minimum of 10 feet from structures and other trees.
- Remove leaf litter (dry leaves/pine needles) from yard, roof and rain gutters.
- Relocate woodpiles or other combustible materials into Zone Two.
- Remove combustible material and vegetation from around and under decks, lanai, or the entire house if foundation is post-and-pier.
- Remove or prune vegetation near windows.

## ZONE TWO

Zone Two extends 30 to 100 feet out from buildings, structures and decks. You can minimize the chance of fire jumping from plant to plant by removing dead material and removing and/or thinning vegetation. The minimum spacing between vegetation is three times the dimension of the plant.

- · Remove "ladder fuels."
- Cut or mow annual grass down to a maximum height of 4 inches.
- Trim tree canopies regularly to keep their branches a minimum of 10 feet from other trees/cluster of trees.
- \* For larger properties, consider areas outside of Zone Two as a third zone to address. Continue reducing ladder fuels, managing fuels, hardening structures, and properly storing combustible materials.

## **Actions You Can Take Today!**

Weed around the property regularly, especially areas that a lawn mower is not appropriate for (tall dry grasses, rocky terrain, etc.)

Remove leaf litter and other debris that accumulate around the building, under vegetation, and other collection areas.

Remove leaf litter, straw and other debris from under and around propane tanks to create 10 feet of clearance around it.

Eliminate ladder fuels by pruning tree branches on trees around the property to within at least 6 feet of the ground, using a bypass lopper (seen above), pruner saw, or long reach/hand pruner.

Remove flammable materials from underneath the house, decks, porches, and lanai. Common flammables include scrap-wood, firewood, and combustible furniture.

Mow the lawn regularly to keep grasses shorter than 4 inches tall around the home. Do not mow in the heat of the day or when the wind is blowing. Never mow in dry vegetation.

#### **Watch Out for Exotic Vegetation**

Non-native trees, such as ironwood (seen below) constantly drop needles, leaves, branches, and other debris, so it's best to stay on top of removing them from the ground before the pile becomes a major project. Consider reforesting these areas with native trees that don't drop large amounts of debris.

Invasive grasses such as guinea and fountain grass grow rapidly when un-managed and can dry out very quickly, creating a major fire hazard. Weed them often and consider replanting with low-lying, drought-tolerant, native ground cover.

## **Defensible Space - Hawaiian Style**

Consider selecting native plants from this list that are most relevant to your area: Maia Pilo 'Ilima Papa 'Ākia Bonamia 'A'ali'i 'Akoko ʻlhi Ma'o Hau Hele Koki'o 'Ūlei Wiliwili Uhiuhi Hala Pepe Koai'a Ohi'a Lehua Koʻokoʻolau 'Ohe Makai 'Iliahi Nehe Alahe'e Ala'ala Wai Nui Kolomona Koai'a

Creating defensible space does not necessarily mean eliminating the presence of greenery on your property. You can still landscape around your home to make it fire-safe without compromising beauty and aesthetics. By planting native, drought-tolerant plants (**xeriscaping**) around your home, you can:

- Protect your home from wildland fire ignition and spread
- · Beautify your property
- Perpetuate an important natural and cultural resource
- Decrease the maintenance needs of your landscaping

For the drier areas of Hawaii, consider that native dryland plants are specially adapted to local conditions and require less upkeep, water, and fire maintenance, saving yourself a great deal of time, money, and resources. Non-native, lush plants often drop hazardous debris and can become fire prone in drought conditions.

#### **Homes with Great Xeriscaping**

#### Did You Know?

The same winds that blow hazardous debris toward a collection area (underneath shrubs, under the lanai, next to outer edges of home, etc.) will likely carry embers during a wildland fire to that same spot, and ignite that pile. That's why it's incredibly important to consistently remove debris from these areas long before a wildland fire occurs.

## **What is a Hardened Home?**

Construction materials and the quality of the defensible space surrounding it are what give a home the best chance to survive a wildland fire. Embers from a wildland fire will find the weak link in your home's fire protection scheme and gain the upper hand because of a small, overlooked or seemingly inconsequential factor. However, there are measures you can take to safeguard your home from wildland fire. While you may not be able to accomplish all the measures listed below, each will increase your home's, and possibly your family's, safety and survival during a wildland fire.

#### **Home Improvements**

#### **ROOFS**

Roofs are the most vulnerable surface where embers land because they can lodge and start a fire. Roof valleys, open ends of barrel tiles and rain **gutters** are all points of entry.

#### **EAVES**

Embers can gather under open **eaves** and ignite exposed wood or other combustible material.

#### VENTS

Embers can enter the attic or other concealed spaces and ignite combustible materials. Vents in eaves and cornices are particularly vulnerable, as are any unscreened **vents**.

#### **WALLS and FENCING**

Combustible siding or other combustible or overlapping materials provide surfaces or crevices for embers to nestle and ignite. Combustible **fencing** can become engulfed and if attached to the home's sidings can carry the fire right to the home.

#### **WINDOWS and DOORS**

Embers can enter gaps in doors, including garage doors. Plants or combustible storage near **windows** can be ignited from embers and generate heat that can break windows and/ or melt combustible frames.

#### **BALCONIES and DECKS**

Embers can collect in or on combustible surfaces or the undersides of decks, lanai, and balconies, ignite the material and enter the home through walls or windows. Post-and-pier homes, common throughout Hawaii, are especially vulnerable since most, if not all, of the underside of the house is exposed.

To harden your home even further, consider protecting your home with a residential fire sprinkler system. In addition to extinguishing a fire started by an ember that enters your home, it also protects you and your family year-round from any fire that may start inside your home.

## **Creating a Safe Ho**

**Roof:** Your roof is the most vulnerable part of your home because it can easily catch fire from windblown embers. Homes with wood-shake or shingle roofs are at high risk of being destroyed during a wildland fire.

Build your roof or re-roof with fire-resistant materials such as composition, **metal** (as seen in picture) or tile. Block any spaces between roof decking and covering to prevent ember intrusion.

Clear pine needles, leaves and other debris from your roof and gutters.

Cut any tree branches within ten feet of your roof.

**Deck/Patio Cover**: Use heavy timber or non-flammable construction material for decks.

Enclose the underside of balconies and decks with fire-resistant materials to prevent embers from blowing underneath.

Keep your deck clear of combustible items, such as baskets, dried flower arrangements and other debris.

The decking surface must be ignition resistant if it's within 10 feet of the home.

Inside: Keep working fire extinguishers on hand. Install smoke alarms on each level of your home and near bedrooms. Test them monthly and change the batteries twice a year.

**Non-Combustible Fencing:** Make sure to use non-combustible fencing to protect your home during a wildland fire.

Home Site and Yard: Ensure you have at least a 100-foot radius of defensible space (cleared vegetation) around your home. Note that even more clearance may be needed for homes in severe hazard areas. This means looking past what you own to determine the impact a common slope or neighbors' yard will have on your property during a wildland fire.

Cut dry weeds and grass before noon when temperatures are cooler to reduce the chance of sparking a fire.

Landscape with fire-resistant plants that have a high moisture content and are low-growing.

Keep woodpiles, propane tanks and combustible materials away from your home and other structures such as garages, barns and sheds.

Ensure that trees are far away from power lines.

**Driveways and Access Roads**: Driveways should be designed to allow fire and emergency vehicles and equipment to reach your house.

Access roads should have a minimum 10-foot clearance on either side of the traveled section of the roadway and should allow for two-way traffic.

Ensure that all gates open inward and are wide enough to accommodate emergency equipment.

Trim trees and shrubs overhanging the road to a minimum of 13 1/2 feet to allow emergency vehicles to pass.

## ome in the WUI

**Chimney:** Cover your chimney and stovepipe outlets with a non-flammable screen of 1/4-inch wire mesh or smaller to prevent embers from escaping and igniting a fire.

Make sure that your chimney is at least 10 feet away from any tree branches.

**Vents:** Vents on homes are particularly vulnerable to flying embers.

All vent openings should be covered with 1/8-inch or smaller metal mesh. Do not use fiberglass or plastic mesh because they can melt and burn.

Attic vents in eaves or cornices should be baffled or otherwise protected to prevent ember intrusion (mesh is not enough).

**Address:** Make sure your address is clearly visible from the road.

**Walls**: Wood products, such as boards, panels or shingles, are common siding materials. However, they are combustible and not good choices for fire-prone areas.

Build or remodel with fire-resistant building materials, such as plaster, cement, masonry or stucco.

Be sure to extend materials from foundation to roof.

Non-Combustible Enclosed Eaves: Box in eaves with non-combustible materials to prevent accumulation of embers.

Raingutters: Screen or enclose rain gutters to prevent accumulation of plant debris.

**Water Supply:** Have multiple garden hoses that are long enough to reach any area of your home and other structures on your property.

If you have a pool or well, consider a pump.

**Garage**: Have a fire extinguisher and tools such as a shovel, rake, bucket and hoe available for fire emergencies.

Install a solid door with self-closing hinges between living areas and the garage. Install weather stripping around and under door to prevent ember intrusion.

Store all combustibles and flammable liquids away from ignition sources.

**Windows:** Heat from a wildland fire can cause windows to break even before the home ignites. This allows burning embers to enter and start internal fires. Single-paned and large windows are particularly vulnerable.

Install dual-paned windows with the exterior pane of tempered glass to reduce the chance of breakage in a fire.

Limit the size and number of windows in your home that face large areas of vegetation.

## **READY, SET, GO!**

Create Your Own Action Guide

Now that you've done everything you can to protect your house, its time to prepare your family. Your **Wildland Fire Action Guide** must be prepared with all members of your household well in advance of a fire. Use these checklists to help you gain a situational awareness of the threat and to prepare your Wildland Fire Action Guide. For more information on property and home preparedness before a fire threat, review the preparedness checklist on the Firewise Communities website, www.firewise.org.

## **Ready – Preparing for the Fire Threat**

#### **Take Action for Your Community**

- □ Talk to your community members and community association about creating a Community Wildfire Protection Plan (CWPP).
   Hawaii Wildfire Management Organization can assist with this process.
- Coordinate with local county CERT teams.
- Get to know your neighbors. If there are any elderly or handicapped residents, or others with limited mobility, plan with them on how you can best assist them in the event of a wildland fire.

- Create a Family Disaster Plan that includes meeting locations and communication plans and rehearse it regularly. Include in your plan the evacuation of pets and large animals such as horses.
- Have fire extinguishers on hand and train your family how to use them.
- Ensure that your family knows where your gas, electric and water main shut-off controls are and how to use them.
- Plan several different evacuation routes.
- Designate an emergency meeting location outside the fire hazard area.
- Assemble an emergency supply kit as recommended by the American Red Cross (www.redcross.org).
- Appoint an out-of-area friend or relative as a point of contact so you can communicate with family members who have relocated.
- Maintain a list of emergency contact numbers posted near your phone and in your emergency supply kit.
- Keep an extra emergency supply kit in your car in case you can't get to your home because of fire.
- Have a portable radio or scanner so you can stay updated on the fire.
- Have a clear list and easy access location for necessary medications, glasses and other health aids.

## **Set – Situational Awareness When a Fire Starts**

	Evacuate as soon as you are set! Do not wait	Ou	tside Checklist
	for evacuation orders. Get out early - you can always return home if it is safe. This protects you, decreases traffic, and allows firefighters to focus on fire suppression. See more under the "Go" section.		Gather up flammable items from the exterior of the house and bring them inside (e.g., patio furniture, children's toys, door mats, etc.) or plac them in your pool.
	Alert family and neighbors.		Turn off propane tanks.
	Dress in appropriate clothing (i.e., clothing made from natural fibers, such as cotton, and work		Don't leave sprinklers on or water running - they can waste critical water pressure.
	boots). Have goggles and a dry bandana or particle mask handy.		Leave exterior lights on.
	Ensure that you have your emergency supply kit on hand that includes all necessary items, such		Back your car into the driveway. Shut doors and roll up windows.
	as a battery powered radio, spare batteries,		Have a ladder available.
	emergency contact numbers, and ample drinking water.		Patrol your property and extinguish all small fires until you leave.
	Stay tuned to your TV or local radio stations for updates, or check the fire department Web site.		Seal attic and ground vents with pre-cut plywood or commercial seals if time permits.
	Remain close to your house, drink plenty of water and keep an eye on your family and pets until you	Ins	side Checklist
	are ready to leave.		Shut all windows and doors, leaving them unlocked.
lf □	You are Trapped: Survival Tips  Shelter away from outside walls.	l -	Remove flammable window shades and curtains and close metal shutters.
П	Bring garden hoses inside house so embers don't	Ιп	Remove lightweight curtains.
П	destroy them.  Patrol inside your home for spot fires and		Move flammable furniture to the center of the room, away from windows and doors.
	extinguish them.	Ιп	Shut off gas at the meter. Turn off pilot lights.
	Wear long sleeves and long pants made of natural fibers such as cotton.		Leave your lights on so firefighters can see your house under smoky conditions.
	Stay hydrated.		Shut off the air conditioning.
	Ensure you can exit the home if it catches fire (remember if it's hot inside the house, it is four to five times hotter outside).		
	Fill sinks and tubs for an emergency water supply.		
	Place wet towels under doors to keep smoke and embers out.		
	After the fire has passed, check your entire property and extinguish any fires or embers.		
	If there are fires that you can not extinguish with a		

small amount of water or in a short period of time,

call 9-1-1.

## **Go – Leave Early**

By leaving early, you give your family the best chance of surviving a wildland fire. You also help firefighters by keeping roads clear of congestion, enabling them to move more freely and do their job in a safer environment.

#### WHEN TO LEAVE

Leave early enough to avoid being caught in fire, smoke or road congestion. Don't wait to be told by authorities to leave. In an intense wildland fire, they may not have time to knock on every door. If you are advised to leave, don't hesitate!

#### **WHERE TO GO**

Leave to a predetermined location (it should be a low-risk area, such as a well-prepared neighbor or relative's house, a Red Cross shelter or evacuation center, motel, etc.). Your local Community Wildfire Protection Plan will also have locations listed.

#### **HOW TO GET THERE**

Have several travel routes in case one route is blocked by the fire or by emergency vehicles and equipment. Choose an escape route away from the fire.

#### **WHAT TO TAKE**

Take your emergency supply kit containing your family and pet's necessary items.

#### **EMERGENCY SUPPLIES**

The American Red Cross recommends every family have an emergency supply kit assembled long before a wildland fire or other emergency occurs. Use the checklist below to help assemble yours. For more information on emergency supplies, visit the American Red Cross Web site at www.redcross.org.

	Three-day supply of water (one gallon per person per day).
	Non-perishable food for all family members and pets (three-day supply).
	First aid kit.
	Flashlight, battery-powered radio, and extra batteries.
	An extra set of car keys, credit cards, cash or traveler's checks.
	Sanitation supplies.
	Extra eyeglasses or contact lenses.
	Important family documents and contact numbers.
	Map marked with evacuation routes.
	Prescriptions or special medications.
	Family photos and other irreplaceable items.
	Easily carried valuables.
	Personal computers (information on hard drives and disks).
	Chargers for cell phones, laptops, etc.
No	te: Keep a pair of old shoes and a flashlight

handy in case of a sudden evacuation at night.

## Local Fire Department Information Numbers (Circle the appropriate contact)

Hawaii (County) Fire Dept. (808) 932-2912

Honolulu Fire Dept. (808) 723-3473

Maui Fire Dept. (808) 876-4690

Kauai Fire Dept. (808) 241-4985

#### Safety Tip

Remember to PRACTICE your evacuation plan each year with your family, and keep it up to date!

## **Emergency Plan Notes**

Use the space below to add any additional information to your family's evacuation plan.

#### Off-island plans during fire season? Plan ahead!

If you are a seasonal resident or property owner, or if you know you will be away, it is critical that you take personal responsibility for your property and the safety of those who may occupy it during your absence. Unmitigated hazards on your property can significantly affect an entire neighborhood, especially adjacent homes and yards. Remember, if an ember lands and ignites a fire on your property, that fire can easily spread and threaten additional lives and homes within the community, whether you are physically present or not. It is up to you to ensure your home, yard, and property are READY at all times.

#### Essential preparedness actions for part-time and traveling residents:

1. Ensure your vegetation and structures will be managed and maintained to withstand embers and mitgate wildfire ignition and spread while you are away.

Keeping your yard lean (via strategic, Firewise planting methods and trimmed grasses and trees), green (meaning watered and alive, not dry or dead), and clean (regularly maintained, no debris or leaf piles) applies all year long. What is your property and vegetation maintenance plan? How will you know if your plan is successfully occurring?

2. Create a wildfire information packet for any seasonal or temporary guests who will be staying at your property, familiarizing yourself with all potential evacuation routes and how they may have changed over the year.

Introduce your guests to neighbors that may need their help evacuating. Who are those neighbors, in which houses do they live, and what are their contact numbers? Where can guests find your emergency supplies box or evacuation go-bag?

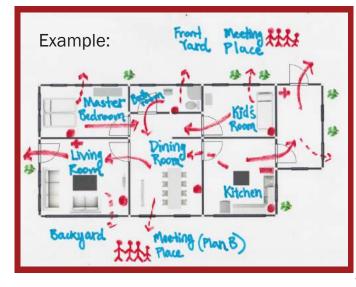

3. Be a good neighbor. Be active in your community, even if you only consider yourself a parttime or seasonal resident.

Get to know your neighbors and provide your contact information to them, so that you can work together to find solutions to unexpected risks or hazards within the community, particularly any stemming from your property or that may endanger your property while you are away.

## **Our Family's Home Evacuation Plan**

Draw a floor plan or map of your home with the space provided below:

- · Show all doors and windows.
- Mark two ways out of each room with arrows (1st choice: solid and 2nd choice: dotted).
- Mark all smoke alarms in the house with a .
   Mark all fire extinguishers with a .
- Pick and mark a main meeting place (and a backup alternative) outside the house where everyone can meet, away from any hazards.
- Remember to practice your plan at least twice a year.

#### Residential Safety Checklist Tips To Improve Family and Property Survival During A Wildland Fire

	Home	Yes	No	
1.	Does your home have a metal, composition, or tile (or other non-combustible) roof with capped ends and covered fascia?			
2.	Are the rain gutters and roof free of leaves, needles and branches?			
3.	Are all vent openings screened with 1/8 inch (or smaller) mesh metal screen?			
4.	Are approved spark arrestors on chimneys?			
5.	Does the house have non-combustible siding material?			
6.	Are the eaves "boxed in" and the decks, lanai, and/or pier-and-posts enclosed?			
7.	Are the windows made of at least double-paned or tempered glass?			
8.	Are the decks, porches, lanai, and other similar areas made of non-combustible material and free of easily combustible material (e.g. plastic furniture)?			
9.	Is all firewood at least 30 feet from the house?			
	Defensible Space	Yes	No	
1.	Is dead vegetation cleared 100 feet from the house? (Consider adding distance due to slope of property.)			
2.	Is there separation between shrubs?			
3.	Are ladder fuels removed?			
4.	Is there a clean and green area extending at least 30 feet from the house?			
5.	Is there a non-combustible area within five feet of the house?			
6.	Is there separation between trees/tree clusters?			
	Emergency Access	Yes	No	
1.	Is the home address visible from the street?			
2.	Is the home address made of fire-resistant materials?			
3.	Are street signs present at every intersection leading to the house?			
4.	Are street signs made of fire-resistant materials?			
5.	Is flammable vegetation within 10 feet of the driveway cleared and are overhanging obstructions removed?			
6.	If a long driveway is present, does it have a suitable turnaround area?			

--This is a high value resource-Please pass this on to others
instead of throwing in the trash.
It could save a life or home.

Ready, Set, Go! www.wildlandfireRSG.org

Hawaii Wildfire
Management Organization
www.hawaiiwildfire.org

### **APPENDIX B**

#### **WEB-BASED SURVEY RESULTS**

#### **APPENDIX B**

#### WEB-BASED SURVEY RESULTS

#### **BACKGROUND**

Using a web-based survey, input was gathered from community members as to their highest priority concerns related to wildfire, along with suggested actions for addressing those concerns. Survey responses were solicited in each of the National Wildland Fire Management Strategy categories- **Resilient Landscapes**, **Fire Adapted Communities**, and **Safe & Effective Firefighting**, to correspond to, and mimic, the discussion that took place during live/virtual workshops for seamless integration of all participant input. An invitation to complete the survey was circulated via email and in person by key community contacts and leaders in November and December, 2020. The invitation letter included an overview of the project, a link to the survey, and contact information of the lead coordinator (HWMO).

#### **RESULTS**

Overall, 27 community members of the Leeward Haleakala area completed the survey. 14 (51.9%) described themselves as residents; 9 (33.3%) as agricultural operators/farmers/ranchers; 4 (14.8%) as representatives of a community group or nonprofit organization; 4 (14.8%) as private company/business representatives; 4 (14.8%) as something else ("homesteader", "part-time resident", "former ranch manager", and "descendant"); 3 (11.1%) as government agency representatives; 3 (11.1%) as natural resource/forestry/soil managers; and, nobody identified as a professional in the public utility sector (or, public works, infrastructure, or water) as well as no planners, architects, engineers, developers, or builders.

#### PARTICIPANT INPUT FOR RESILIENT LANDSCAPES CATEGORY

Resilient Landscapes Concerns		
Top Concerns	% Reporting it as a Top 3 Concern	
Agriculture and farming are impacted by fire and/or are needed for managing vegetation	62.1	
Flammable vegetation/fuels that are creating the high fire hazard	59.3	
Water quality and availability are impacted by fire and are needed for fighting fires and prevention	59.3	
Sensitive natural and cultural resources that are threatened by fire	55.6	
Ecological restoration in needed to prevent fires or overcome its impacts	44.4	
Other	7.5	

When respondents were asked to select their top three highest priority concerns related to protecting natural and cultural resources from wildfire (also referred to as working toward resilient landscape), 62.1% of respondents indicated that "agriculture and farming are impacted by fire and/or are needed for managing vegetation" was among the public's highest priorities, followed by the "flammable vegetation/fuels that are creating the high fire hazard" (59.3%), "water quality and availability are impacted by fire and are needed for fighting fires and prevention" (59.3%), the "sensitive natural and cultural resources that are threatened by fire" (55.6%), "ecological restoration is needed to prevent fires or overcome its impacts" (44.4%), and something else not listed (7.4%).

Respondents were asked one open-ended question about what they thought could be done to protect natural and cultural resources from wildfire in the area. 19 individuals (70.4%) responded to the question, and responses were coded and the following categories emerged (from the most to least number of related responses).

Resilient Landscapes: Vegetation-related (8 related responses)	
Recommendation	Specific written comments
Install new and/or maintain already existing firebreaks	"Firebreaks in flammable vegetation/fuels" "Control fuel load with grazing, maintain fire breaks" "Maintained fire breaks" "Create more fire and green breaks"
Strategically manage the vegetation	"Maintenance of surrounding areas"  "removal of invasive species"  "Vegetation management along the road"

Resilient Landscapes: Pre-fire planning and action (12 responses)	
Recommendation	Specific written comments
Do more planning for wildfires in general	"Planning and prevention measures"  "Being More Proactive vs. Just Being Reactive"  "Ability to obtain/apply fire suppression materials"
Do more planning, in general, around the protection of natural and cultural sites	"The preservation of all natural resources in and around Kahikinui" "Identify and map high priority protection sites"
Improve/increase access to water for suppression purposes	"Strategic reservoirs for water"  "Adequate access and supply of water"  "Having water tanks available in different locations incase of fires for accessibility"

Plan for and reduce risks ahead of wildfire season	"Control the ungulates, fencing, fire breaks, gates, control access"  "Identifying it and removing fire hazards!"
Improve infrastructure (for suppression and evacuation)	"Alternate established legal access/ evacuation routes" "Improve road access and expand road systems"

Resilient Landscapes: Community-related (4 related responses)		
Recommendation	Specific written comments	
Build community awareness/ action	"Aware and responsible neighborhood" "Increase community outreach" "Community outreach programs"	
Monitor suspicious activity	"Create community watch programs" "Install remote cameras to monitor for vandals, dumping, and abandoned vehicles"	

Resilient Landscapes: Policy-related (1 related response)	
Recommendation	Specific written comments
Creates policies that reduce roadside ignition potential	"Start by limiting the number of tourists going around the road to Hana"

Resilient Landscapes: During and post fires (2 related responses)	
Recommendation	Specific written comments
Closer monitoring and better management of wildfires	"Closer monitoring and better management"
Have a post-fire plan	"Accelerate restoration efforts"

Participants were also given the opportunity to provide additional comments and/or suggestions related to managing the vegetation/fuels in the area. Those included the following:

- Come up with a proactive plan regarding arson (automated cameras), community response and awareness etc.
- Do not allow any more wind farms to be installed in the area! They are an abomination to the aina and the seabirds.
- The reference ecosystem, which had much less frequent fire, had significantly more bare ground and rock with significantly less biofuels, especially at lower elevations. To recover vegetation cover with much lower biomass, prioritize ecological restoration with the goal of grass suppression through native vegetation cover.
- Seems like certain areas, specifically near roads, would benefit from brush management by mechanical removal, physical grazing/browsing, and or chemical control.
- Volunteer fire personnel and appropriate wildland fire apparatus stationed in the area
- How do you prevent fires when they are deliberately done? This is a frustrating issue we face
- Controlled/managed grazing is critical for reducing the fuel load
- Funds for brush abatement
- Improve signage for safety of responders and community members, prioritize restoration, firebreak creation, and water source establishment
- It's wild over there and the wind is usually nuking, often the fires burn themselves out before crews get there. I'd bet 99.9% of ignitions over there are from lit cigarettes thrown from cars, or a car on fire.

#### PARTICIPANT INPUT FOR FIRE ADAPTED COMMUNITIES CATEGORY

When respondents were asked to select their top three highest priority wildfire concerns related to the people and communities of Leeward Haleakala, 63.0% of respondents indicated that "the need for water (for grazing, planting, firefighting, etc.)" was among the public's highest priority concerns, followed by "more enforcement of laws (e.g., abandoned car dumping)" (40.7%), "lack of funding for wildfire-related projects" (29.6%), "residents need more training and support for residents to get their homes, yards, and families prepared" (29.6%), "human-caused wildfire ignitions need to be addressed" (25.9%), "community planning needs to include more focus on wildfire readiness" (25.9%), "more training is needed related to wildfire mitigation strategies on wildland areas" (18.5%), "the need for better roads, more road signs, and community/firefighter access around communities" (18.5%), "farmers and/or large landowners need to be more engaged in fire issues" (14.8%), "the need for better garbage and green waste dumping options" (7.4%), "the need for elected officials to be more involved in fire issues" (7.4%), something else not listed

(7.4%), and a "general lack of awareness around wildfire issues" (3.7%). Nobody indicated that "private businesses need to be more engaged in fire issues" as a top concern.

Fire Adapted Communities Concerns	
Top Concerns	% Reporting it as a Top 3 Concern
The need for water (grazing, planting, firefighting, etc.)	63.0
More enforcement of laws (e.g. abandoned car dumping)	40.7
Lack of funding for wildfire-related projects	29.6
Residents need more training and support to get their homes, yards, and families prepared for wildfire	29.6
Human-caused wildfire ignitions need to be addressed	25.9
Community planning needs to include more focus on wildfire readiness	25.9
More training is needed related to wildfire mitigation strategies on wildland areas	18.5
The need for better roads, more road signs, and community/ firefighter access around communities	18.5
Farmers and/or large landowners need to be more engaged in fire issues	14.8
The need for better garbage and green waste dumping options	7.4
The need for elected officials to be more involved in fire issues	7.4
Other	7.4
General lack of awareness around wildfire issues	3.7

Respondents were asked one open-ended question about what they thought could be done to address the community (residents, businesses, schools, infrastructure, etc.) part of wildfire issues in Leeward Haleakala. 17 individuals (63.0%) responded to the question, and responses were coded and the following categories emerged (from the most to least number of related responses).

## Fire Adapted Communities: Preparedness outreach/education (11 related responses)

Recommendation	Specific written comments
Conduct more awareness campaigns	"Public awareness campaigns about danger and awareness"  "Be aware no throwing out of cigarettes"  "Since arson is frequently a cause of fires we need to make everyone aware of the need for vigilance"  "Teaching and education around this subject"  "Education and awareness training on preventive measures"  "Educate about invasive species and restoration"  "Conduct presentations at community centers or perhaps try to do some outreach with schools or youth of the area to inform them and have them engage their parents with conversations and readiness plans etc."
Get information into the hands of those that need it	"Provide the community "the location of fire hydrants or other water sources"  "Provide the community the website and phone contact for emergency fire situations"  "Education about wildfire control, dumping issues"
Prioritize wildfire outreach/ education in the budget	"Funding for awareness

## Fire Adapted Communities: Preparedness planning and action (8 related responses)

Recommendation	Specific written comments
Put things into place so that communities are better prepared ahead of time	"We should consider something along the lines of a rapid response phone number." Install and activate "unique fire alarm warning sirens" Plan for "alternate legal evacuation routes through private roadways"

Have a community plan in place ahead of time	"Emergency protocols and contacts"  "A plan" and "create community response plans and public monitoring programs"  "Each District should have a plan with maps and a Contact phone tree. Bring awareness and a plan of where we would go, landing zones, where the commanding post would be, how we work with operations in providing food or items to assist, etc."
Install roadside signage	"Perhaps establish signs at strategic locations along the road, something like US Forest Service uses in some areas to inform people about current fire risks based on recent weather trends, biomass accumulation, etc"  "Increase signage and warning systems during droughts and in wet months to create awareness of fuels"

Fire Adapted Communities: More community/agency engagement (6 related responses)	
Recommendation	Specific written comments
Build/maintain positive community/agency relationships	"Better engagement by all"  "Meet with the community associations"  "Reaching out"  "Attend the Kaupo Community Association meetings and ask to be on their agenda"  "Assurance of government's preliminary involvement for insurance and legal protection of good Samaritan efforts during dire situations"
All hands, all lands approach	"All-hands approach"

Fire Adapted Communities: Capacity building (2 related responses)	
Recommendation	Specific written comments
Build capacity of wildfire professionals and practitioners	"Zoom meetings & trainings" "Trainings"

#### PARTICIPANT INPUT FOR SAFE & EFFECTIVE FIREFIGHTING CATEGORY

When respondents were asked to select their top three highest priority concerns related to safe and effective firefighting in the area, adequate water and/or water infrastructure for firefighting (77.8% top priority) was among the public's highest priorities, followed by adequate access for firefighters to be able to fight fires (59.3%), communications during fire between agencies or to the community (40.7%), response time it takes for firefighters to arrive (37.0%), safety of firefighters (29.6%), adequate equipment/training of responding fire agencies (25.9%), evacuation of community (22.2%), adequate personnel and staffing of responding fire agencies (14.8%), and something else not listed (7.4%) (Road G improvements and need a 2" hydrant). Agency jurisdiction issues were not a priority concern for any respondents.

Safe & Effective Firefighting Concerns	
Top Concerns	% Reporting it as a Top 3 Concern
Adequate water and/or water infrastructure for firefighting	77.8
Adequate access for firefighters to fight fire	59.3
Communications during fires between agencies and communities	40.7
Response time (for firefighters to respond to fire)	37.0
Safety of firefighters	29.6
Adequate equipment and/or training of agency responders	25.9
Evacuation of community	22.2
Adequate personnel and staffing of agency responders	14.8
Other	7.4
Agency jurisdiction issues	0.0

When respondents were asked to select their top three highest priority concerns related to safe and effective firefighting in the area, adequate water and/or water infrastructure for firefighting (77.8% top priority) was among the public's highest priorities, followed by adequate access for firefighters to be able to fight fires (59.3%), communications during fire between agencies or to the community (40.7%), response time it takes for firefighters to arrive (37.0%), safety of firefighters (29.6%), adequate equipment/training of responding fire agencies (25.9%), evacuation of community (22.2%), adequate personnel and staffing of

responding fire agencies (14.8%), and something else not listed (7.4%) (Road G improvements and need a 2" hydrant). Agency jurisdiction issues were not a priority concern for any respondents.

Respondents were asked one open-ended question about what they thought could be done to improve emergency response and firefighting in the area. 17 individuals (58.6%) responded to the question, and their responses were coded and the following categories emerged (from the most to least number of related responses).

Safe & Effective Firefighting: Firefighting personnel (6 related responses)	
Recommendation	Specific written comments
Prioritize new fire stations	"We need a fire station in Kaupo!"  "Have a volunteer fire fighting outpost in the area."  "Fire emergency vehicles [are] too far away."  "Improve rapid response capability by [building] a fire substation"  "Fire emergency vehicles [are] too far away"
Ensure adequate fire- fighting capacity	"Have appropriate personnel to address fire needs"

Safe & Effective Firefighting: Water (5 related responses)	
Recommendation	Specific written comments
Ensure adequate water supplies	"Have appropriate water sources." "Help with installing water tanks."
Improve access to water	"Water to Kahikinui homestead" "Better access to water" "Helicopter availability"

Safe & Effective Firefighting: Planning, coordination, and communications (5 related responses)	
Recommendation	Specific written comments
Do more of it	"Planning and coordination"

stations of Kula and Hana."

"Get a good map of all roads and water tanks to the fire

Include more people	"Inclusive agencies communications to landowner and the enclaved community"  "Involve residential community, not just stakeholders"  "Education of emergency personnel on the leeward areas  (often they don't know there way around back here)"
	(often they don't know there way around back here)"

Safe & Effective Firefighting: Road improvements (4 related responses)		
Recommendation	Specific written comments	
Do more of it	"Road improvements"  "Continuing the road to lots 103"  "Improve road conditions for residents and emergency vehicles"	
Be strategic about it	"Travel time from Kula to the leeward side cannot be much improved due to the road. Paving the last mile or two into Kaupo would help a bit."	

Safe & Effective Firefighting: Vegetation management (2 related responses)		
Recommendation	Specific written comments	
Maintain fuel loads on state lands	"Control of fuel load on state lands"	
Maintain fire breaks	"Maintenance of fire breaks"	

#### STRENGTH, ASSETS, AND OPPORTUNITIES

15 participants provided their perspectives on the strengths, assets, and opportunities that exist for addressing wildfire issues in Leeward Haleakala.

Strengths, Assets, and Opportunities		
Category	Examples of specific written comments	
Fire department/agency	"We have a great fire department" "Experienced fire professionals willing to help"	
Leadership	"DLNR District Leadership (Lance)"	

Community	"Positive momentum with Kahikinui Homestead" "Landowners willing to collaborate"
Ranching community	"Willingness of local large ranchers to help our local communities"  "We have several large ranchers with livestock in the area that are capable of managed grazing if given the opportunity."
Shared vision	"Community awareness"  "It seems like a topic that all community members agree on as a threat and something to work together to prevent, respond to, and mitigate after fire. These emergency situations seem like opportunities to build community and communication around common goals of safety and protecting resources."
Resources	"I know Maui uses helicopters to fight fires. I think this is an asset for the leeward side."  "Accessing private community resources to help"
Partnerships	"Involvement of residents and citizens to work on a common problem"  "Bridging together the divided community"  "LHWRP can implement large-scale native habitat restoration with funding increases"
Landscape	"Its remote enough that if we implement something, not too many people would need to be consulted"

Other affiliations, partnerships, and/or projects that might connect to this wildfire planning effort for the Leeward Haleakala area that were noted by participants included: Ka 'Ohana O Kahikinui (KOOK), Leeward Haleakalā Watershed Restoration Partnership (LHWRP), Ulupalakua Ranch, Maui Cattlemen's Association, Kahikinui Hawaiian Homes Association, Aha Moku O Kaupō, Wakiu Community Development Corporation, independent contractors, the Hawai'i Green Growth Local2030 Hub, Friends of St. Joseph Catholic Church at Kaupo, Maui Fire Department personnel, University of Hawaii, Maui Conservation Alliance, and residents of Kahikinui Hawaiian Homelands in Kahikinui and Kanaio residents.

The following county, state, and federal representatives have a high level of interest in the protection of the Leeward Haleakalā area from wildfire, and have reviewed and support this Community Wildfire Protection Plan.

State Department of Land and Natural Resources- Division of Forestry and Wildlife
Kalanimoku Building
1151 Punchbowl St. Room 325 Honolulu, HI 96813

Maui Fire Department 200 Dairy Road Wailuku, HI 96793

Maui Emergency Management Agency 200 S. High Street Wailuku, HI 96793
