

SPACECRAFT Tanks in the Satellite Industry – A Sales Manager's Perspective

Matthias Gondeck,

Head of Sales Spacecraft Tanks at MT Aerospace AG

The market landscape of spacecraft platforms has been dominated by chemical propulsion concepts in the past. Predominately monopropellant systems for LEO-/MEO- applications and bi-propellant solutions for larger platforms such as GEO usage. However, increasing customer acceptance of electric propulsion (EP) solutions changes the design of satellites and the way they are being build and operated.

This lecture focuses on MT Aerospace's tank portfolio available (technical solutions) and the way they are marketed to the international satellite prime contractors (sales environment).
