What you can do
There are easy, economical ways to help birds see your windows.

Simple and it works!
Hanging cords, strings, or ribbons in front (outside) of your windows on 4” centers can be effective and unobtrusive. Simple and easy to do yourself.

Hanging cords, strings, or ribbons in front (outside) of your windows on 4” centers can be effective and unobtrusive. Simple and easy to do yourself.

American Bird Conservancy Bird Tape

Less can be more! Smaller markers can be effective and block less of your view.

Surface Treatments
Any visible marker you place on the window can be effective. The shape does not matter, but spacing does; must follow the 2 x 4 Rule.

Other things you can do include keeping light colored blinds partially closed, leave exterior screens in year-round, move house plants back from windows.

Tempera paint can be a good temporary solution – paint a picture, draw lines, or cover the entire window.

CollidEscape™
A perforated window film appears solid from the outside, but allows viewing from the inside. Can be printed in any color to match your home or with any image you would like.

Feather Friendly® Do-it-yourself Tape

Visit the Acopian BirdSavers website for plans or to order them custom made for your windows.

Keep in mind……
Outside is best. Anything you use to help birds realize there is a glass barrier in front of them works best and sometimes only, if it is on the outside of the window.

Location and numbers matter. The more birds in close proximity to a window, the more potential for bird-window collisions. Windows facing feeders and good habitat should be treated first.

Defensive behavior. Birds that repeatedly fly against a window are fighting their own reflection, thinking it is a rival bird. This situation is best handled by temporarily covering the entire window to block the reflection. You can use anything, even simple bar soap or tempera paint. After a few days simply wash it off. Reapply if needed.
Why collisions happen
Collisions occur for two main reasons: Reflections and the “see-through” effect.

Reflections Birds see habitat and open sky reflected on our windows. Almost any glass can act like a perfect mirror under certain lighting conditions. Deceived by the reflection, they crash into the solid glass trying to reach what they see.

See-through Wherever birds can see habitat or sky through glass, such as windows opposite one another (above), glass walkways, sunrooms, glass enclosed porches, etc., the result can be lethal. This is one time where closing blinds can be very effective in preventing collisions.

What we are doing
The Bird-window Collision Working Group (BCWG) is actively reaching out to our communities to educate the public about the serious threat windows pose to our birds and how to prevent collisions. With the median estimate of 599 million collisions annually in the USA, this is perhaps the leading human-caused avian mortality our birds face on a daily basis.

Initial printing funded by a grant from the National Audubon Society

The Problem
Windows in our homes kill hundreds of millions of birds every year. One million a day is the low estimate!

Most of us have heard the “thud” of a bird crashing into one of our windows. Most collisions are not as obvious as the one above of a Mourning Dove.

Sad facts:
✦ Up to 50% of bird-window collisions leave no evidence at all.
✦ Many of the birds that fly away, likely die later of their injuries.
✦ Birds most often suffer concussions and internal injuries which can take days to kill them. They do not break their necks.
✦ If a collision kills a parent bird, the young will most likely also die.
✦ Window collisions kill both the fit and unfit, risking weakening the gene pool.
✦ This is all preventable if people took action at their own homes.
