Satu Bumi

amazing glass fibre technology

About Satu Bumi *(Pronounced Sartoo Boomii)*

Satu Bumi is a fully Australian owned manufacturer of high quality Glass Fibre Reinforced Concrete (GFRC) consumer and commercial products based on international product and manufacturing process standards. Satu Bumi's sales and marketing team are in Australia and its GFRC manufacturing facilities are in Yogyakarta, Indonesia.

Why Manufacture in Indonesia

Satu Bumi chose Yogyakarta, Indonesia, for the location of its factory because;

- Indonesia provides a very low cost of production base with which very few countries can compete – this enables Satu Bumi's product pricing to be very competitive
- The Indonesian climate is hot and humid which is perfect for the manufacture and curing of GFRC products – this facilitates the production of very high quality GFRC products.

Why Choose to Manufacture GFRC

GFRC is an amazing technology that can be used to make incredibly durable products for the commercial landscape market. GFRC is highly sort after by Landscape Architects because;

- GFRC can be used to provide a myriad of different shapes, sizes, textures and colours that provide amazing design flexibility.
- GFRC can be engineered to provide products with industrial grade structural strength.
- GFRC is incredibly durable and weather resistant.

These attributes make GFRC technology a favourite amongst Landscape Architects throughout the world when they are specifying outside pots, planters, water features and furniture.

What is Commercial Grade GFRC

Satu Bumi manufactures both Domestic Grade and Commercial Grade GFRC products.

If made correctly, all GFRC products are strong and durable. However, the architectural standards typically specified by professional Landscape

Architects are often much higher than what would generally be required in the domestic market. Greater passing traffic and the increased potential for litigation in the commercial landscape industry necessitates higher product engineering standards for strength, durability and water resistance. All of which add to the complexity of production processes, additional cost of raw materials and adherence to higher quality control standards requiring additional expertise and/or cost that would not normally be absorbable in the pricing of domestic grade GFRC products.

Why Choose Satu Bumi

- Satu Bumi has a substantial catalogue of GFRC products in standard industry shapes and sizes – this simplifies the selection process when choosing products for specific projects.
- Satu Bumi has an impressive product engineering team of artists and technicians that provide design and proof of concept services for those wanting GFRC products produced to their specific requirements based on the following principles;

"fit for purpose" by being structurally sound and engineered for the intended purpose.

"fit for transport" by being well packaged for transport from the factory to the final destination.

"fit for customer" by being aesthetically appealing, long lasting and competitively priced.

- Satu Bumi has approximately 200 staff and 10,000 square meters of production, warehousing, administration and logistics space – this means that Satu Bumi can handle both large and small volume orders comfortably and reliably.
- Satu Bumi follows international product and process standards in its factory in Yogyakarta – this ensure that Satu Bumi's products are of a consistently high quality.
- Satu Bumi provides a 100% guarantee on manufacturing defects – this provides Satu Bumi's customers with a high level of comfort over commercial risks.
