'Don' Falcata Alfalfa
Yellow Flowered Alfalfa (Medicago sativa ssp. falcata)

A new approach in alfalfa development—a grazing type alfalfa meant exclusively for mixed grass plantings on semiarid rangelands and irrigated pastures in the Western US.

- Extremely persistent in harsh and competitive grazing applications on semiarid rangelands and irrigated pastures

- Significantly more persistent in grazing applications than typical purple flowered alfalfas

- Nitrogen-fixing legume increases the productivity of mixed grass rangelands and pastures

- Drought-tolerant and winter-hardy due to fibrous roots and deeply set crown and buds

- Enters complete dormancy when water is limited for extended periods, regrowing when moisture becomes adequate

- Will not dominate in mixed plantings with grasses; low growth form stays well below the canopy of most grasses

- Advantageous for Conservation Reserve Program-type plantings as a persistent, nonaggressive rangeland legume

- Valuable for land managers needing affordable, drought-tolerant legume species to improve rangelands and pastures
