Professor: Alright class, before we get started I'd like to remind everyone that the student rec center is offering free meningitis b vaccines all week. I encourage you all to take advantage of it.

SFX: STUDENT LAUGHTER

Student: Yeah, because we're all soooo likely to get it.

Professor: Meningitis is actually a very dangerous disease that you all should take seriously.

Student 2: Well actually, 1 in every 10,879 people contract the virus every year. That's not a lot considering the amount of people that go to this school.

Professor: You're right and last year, 850 died from meningitis and 25,000 people contracted the virus just in the U.S. That's something to look at considering that being on a school campus greatly increases your chances of contracting the virus.

Student 3: My friend got the vaccine and had a terrible fever for about 3 days after. Is it even worth it?

Professor: There are possible side-effects, however they are very rare and the majority of risks are mild. The side-effects from the vaccine are better than the alternative, contracting meningitis.

Student 1: Well I don't want to get it, especially if I feel sick afterwards.

Professor: If you won't get the vaccine for yourself, look around you. There are so many other people that could be affected by your decision. Get it for them.
