## Quick Start Guide

### H<sub>2</sub>O ResQ Water Treatment Kit for Sure Water Tanks

---

A tested treatment provided by an outside company to preserve water for 5 years.

1. After filling your tank, check for any leaks or dripping. Let it sit overnight if needed.
2. You don't need to add any chlorine tablets if filling your tank from a chlorinated city water source. If you are filling from a non-chlorinated source, such as a private water well, add one chlorine tablet per 50 gallons. We recommend the following quantities:
  - **260** gallon tank: add 5 tablets
  - **525** gallon tank: add 10 tablets

All left over tablets can be stored for additional water treatment during an emergency.

3. Now add the Copper/Silver Ion liquid – you may do this during or after filling your tank. Remove cap (and dripper) and pour into the water through the opening at the top of your tank. There is no need to stir or mix as treatment will diffuse on its own. Also, this treatment won't alter the taste of the water. We recommend the following quantities:
  - **260** gallon tank: add one bottle (one Water Treatment kit)
  - **525** gallon tank: add two bottles (two Water Treatment kits)

Return and secure the tank lid. Your water is now ready for future use.

4. This Water Treatment kit has testing components to check the water quality after several years. To do this simply follow the instructions inside the kit.
