House on Steigereiland

In 2006 the clients were informed that they have been allotted a plot on the Steigereiland on island IJburg. This design by Emiel Lamers Architectures complies with building regulations but also develops the size of the building envelope to the absolute maximum. The two-story house is 15 by six meters. A small playroom is situated downstairs, next to the entrance hall and is connected to the three-meter-high living area and open kitchen by a window. Four bedrooms and a spacious bathroom are located on the upper floor. A frosted window, positioned on the side of the house, provides plenty of light for the landing. The house was built within a short timeframe, with a pre-cast concrete building system.

Blok K / Verdana

Blok K is part of a master plan for 550 dwellings by Frits van Dongen of de Architecten Cie. It is part of 16 blocks that are referred to as 'hidden delights'. The ten units within the building are organized according to a 'back to back' system and are accessed from a corridor in the middle of the block; all have direct access on street level. Water and gas meters are located towards the interior hallways and stairs, tucked away into the darker areas, allowing the façades to benefit from the light and view of the park. In order to optimize the urban envelop, all dwellings are deformed, but the blocks keeps it's initial total volume. By shifting the access alley all units are both stretched and compressed, either in height or length, but each still has the given volume of about 630 cubic meters.
