

# **UK SAILMAKERS ACCUMEASURE QUICK START MANUAL**

## **WHAT THIS PROGRAM DOES**

AccuMeasure is a program to read a sail's sectional shape from digital photographs. It runs on computers running Windows 98 and higher. AccuMeasure will read all popular image file formats including JPEG, TIFF, BMP and PCX. If you have a paper print, you'll need to scan it and save the file in any of the above formats.

## **PHOTO NEEDS**

Before taking a shot, know that the look of the sail changes with the angle and camera lens you use. In order to have pictures that will let you compare apples with apples, you need to use the same camera, zoomed out to the same focal length for all your photos. To make your comparisons even more valuable, take all the pictures of a particular sail from the same place. For camber shape shots, you want to be in the middle of the foot of the sail. When shooting the mainsail, take your shot from the middle of the boom and slightly to windward. Get as close to the sail as you can and aim the camera toward the head of the sail. When taking camber shots of a genoa, lie on your back to get the camera as low as possible, so that your camera is at the middle of the foot. Then hold the camera so that the lowest draft stripe runs diagonally across the frame. Shooting on a diagonal gets more of the stripe into the picture. If the bottom stripe still does not fit into the frame, make sure to capture the front of the stripe where most of the curve should be. AccuMeasure will let you locate the aft point of the draft stripe during the measuring process.

To ensure that all your pictures can be reliably compared, make marks on the boom and the deck where to shoot from. Since the foot length of your genoas varies, you'll have to make different marks for your No. 1, No. 2 and No. 3 genoas.

## **INSTALLING THE PROGRAM**

After you download the program, you will see a UK icon on your desktop. This is the installer program; double click on it to start the installation process. Once the installation is complete, you'll see an open window of the AccuMeasure folder with the AccuMeasure program icon. Before running the program make a shortcut for the program and place it on your desktop. Do this by clicking the right mouse button and then selecting CREATE SHORTCUT. A duplicate icon will appear in the window. Just drag the duplicate to the desktop. Now close the

**Figure 1: Spline Tools and Information Window**

window, move the installer program icon to the trash and you are ready to go.

## **STARTING THE PROGRAM**

Double click on the shortcut icon to start the program. Go to the file menu and choose OPEN. The install program comes with three sample pictures for you to practice on. To follow along with these instructions, open the file titled J44LTNO1. The other two sample files are NITEMA~1 and SWAN48M. When you left click once on any image file, you will see a thumbnail preview of it to the right. To open a file, double click on its name. If the picture does not fill the screen, click on the MAXIMIZE WINDOW button. It's the middle of the three buttons in the top right of the picture window's title bar.

## **TAKING MEASUREMENTS**

Start out by measuring the sail at the top draft stripe. To line up the spline tool with the draft stripe, zoom in to the draft stripe. Do this by putting the cursor over one end of the stripe, then hold down the right mouse button and drag across the picture to the other end of the draft stripe. Before letting go of the right button, make sure the rectangle that defines the zoom area encompasses the entire draft stripe. If you accidentally zoomed too far and cut off some of the draft stripe, double click the right mouse button to zoom back out.

Now click on the Top Draft Stripe Spline tool. See Figure 1 above. An airfoil shaped line will show up on your photo. Move the cursor arrow over the front end of the spline, press down the left mouse button and hold it down while moving the front of the spline to the front of the draft stripe. Now move the back end of the spline to the back end of the top draft stripe.

You'll notice in the example in Figure 2 that we had to use "our best judgement" in placing the aft point of the spline since a spreader obscures the back end of the draft stripe.

Next comes the most important step, finding the depth of the sail (Max. Camber) and how far back from the front of the sail the maximum depth point is (Draft Position). To do this, move the cursor arrow over the Max. Camber point of the measurement spline. This point is the small circle at the end of the dotted line running perpendicular to the dotted line connecting the forward and aft points of the spline. Once you have the arrow over the spline, depress the left mouse button and hold it down while you drag that point along the draft stripe. Stop dragging and let go of the mouse button when you get the highest reading in the Camber (max) box of the Section Window. In Figure 2 below, the Camber (max) is 0.192 or 19.2%.

The small section windows can be dragged around the screen by moving the cursor arrow over any point of the section window's title bar and then clicking and holding

**Figure 2: Finding Max Camber and Draft Position**

down the left mouse button and then dragging the window wherever you want it. When finding the max. camber, move the section window close to the mid point of the draft so that you can watch the max camber number change as you drag the max. camber point around.

Next, drag the small white circles around so that the spline perfectly traces the draft stripe.

In the section window of Figure 2, you'll see that the Draft Position is 0.55, which means that the maximum camber position, is 55% aft.

Once you finish with the top draft stripe, zoom out by double clicking the right mouse button, or go to the VIEW menu and choose FIT IN WINDOW. Then zoom in on the middle draft stripe. Select the middle draft stripe spline and measure as described above. Some camera lenses might not be capable of capturing the full bottom draft stripe of a No. 1 Genoa or mainsail. If one end of the draft stripe is cut off, AccuMeasure lets you move the end of the spline into the white space to the right of the picture.

If the missing part of the stripe is on the left side of the picture, you'll need to "Flop" the image so that the missing part is on the right side. Do this by going to the VIEW menu and choose the MIRROR option. Note that when you click on the spline tools, they will put the spline on the page with the front of the spline

toward the right. If you Flop the picture with the MIRROR option, you will have to drag the forward point of the spline around to the left where the forward end of the draft stripe has been moved.

**Figure 3: Information Window**

## SAILING CONDITIONS

After measuring the draft stripes, open the INFORMATION window to record the wind and trimming settings when the picture was taken. The information in this box is very important for interpreting the spline measurements. To open the INFORMATION window, go to the TOOLS menu and choose the first option,

which is INFORMATION. You can also click on the INFORMATION icon in the tool bar, which is just to the left of the TOP SPLINE icon.

## SAVING YOUR WORK

To save your file with all the data from the spline measurements and information notes, go to the FILE menu and choose SAVE AS. Make sure that SAVE FILE TYPE is "Ukimage 24-bit color (#.uki). This way all the measurement data will be saved with the picture. Any other file format will not save your measurement data.

**Figure 4B. Printout from AccuMeasure**

Printing a .uki formatted file creates hard copy showing the picture, splines and all the measurement data and historical information. You can save the printouts in a file or binder to document different trimming techniques, how the sail behaves in different wind conditions or to send to your UK Sailmakers representative for further analysis. Figure 4 on the next page is a sample printout. Besides printing hard copy, you can e-mail a .uki formatted file to your UK Sailmakers representative. The file size does not increase from the size of the original photo.

Thank you for taking the time to read these instructions. Feel free to look at the UK ACCUMEASURE REFERENCE MANUAL for more information. It is the other PDF that was part of the AccuMeasure download.
