### Alertus Desktop Notification Software Release

Alertus Technologies, a provider of emergency mass notification solutions, announces software updates and new emergency notification hardware as part of the Alertus Summer 2017 Software Release. Highlighting the release are new innovative Alertus Desktop Notification features that will help organizations save valuable seconds during an emergency situation.

The update adds support for the Alertus Desktop Notification to allow users to receive alerts through a locked computer screen. When activated, the system immediately overrides a locked computer screen, negating the need for users to unlock the computer first.

Additionally, new support for Wake-on-LAN capability will automatically awaken sleeping Windows desktops upon receipt of an alert. If recipients are away from their computers when an alert goes out, they will immediately see a full-screen alert upon return instead of seeing the message after waking their machine. **alertus.com**

### Genetec Announces Latest Version of AutoVu Free-Flow

Genetec, a provider of open architecture security and public safety solutions, announces its latest version of AutoVu Free-Flow off-street parking management solution.

Designed to help increase parking enforcement efficiency by providing a real-time inventory of vehicles parked illegally in monitored parking lots, Free-Flow will now be offered within Genetec Security Center, the company's unified security platform that combines video surveillance, access control and automatic license plate recognition (ALPR).

Catching parked vehicles in violation is a challenge for many parking organizations. Business managers estimate that they apprehend less than a quarter of parking violators. With AutoVu Free-Flow, parking enforcement officers can easily identify lots with unenforced violations and dynamically adjust their patrol routes to maximize violation capture rates. **genetec.com**

### Code Blue Introduces New EmerComm Technology

Code Blue, a manufacturer of durable emergency communication solutions, releases EmerComm, a new device operating system. With advanced security and functionality, EmerComm delivers intelligence by giving emergency phones and other communication devices the capabilities of a full computer. This means creating a system that views its platform as an agnostic system of sensors and indicators, with phone functionality just one of the many layers it is capable of managing, according to the company.

Using this new operating system, Code Blue will be able to offer new products that provide a wide range of applications and functionality. Code Blue offered a sneak preview of the devices powered by EmerComm at ISC West this year. **codeblue.com**

### Traka Intelligent Management Systems

Traka, a manufacturer of key management and control solutions, enables businesses to secure, manage and audit the use of almost any physical asset, including keys, electronic devices, secure areas, equipment, machinery and vehicles.

Traka provides intelligent key and equipment management to better protect your important assets — resulting in improved efficiency, reduced downtime, less damage and fewer losses, which in turn means less administration and lower operating costs.

Beyond simply controlling access to physical keys and assets, these solutions can bridge the gap in existing security strategies and empower any organization to improve the processes that affect its bottom line. An integrated Traka solution can help businesses increase operational efficiency, maximize utilization and strictly enforce security and safety protocols — all from the systems currently being used. **traka.com**
