

Augmented reality therapy

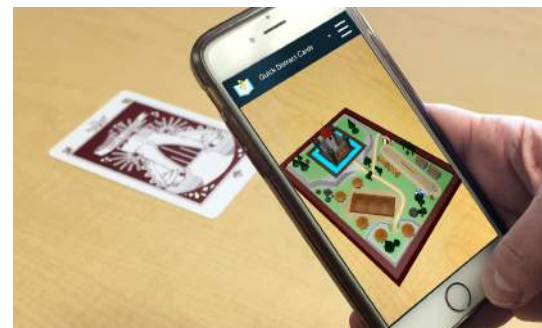

Hospital treatment can be scary or traumatic for some children. On-site therapists need effective and easy-to-use tools to support patients. SpellBound improves cooperation with medical treatment, reducing trauma and improving outcomes for patients using augmented reality.

"The patient loved it so much. He was smiling and laughing throughout the procedure. He was making the same sounds as the animals, The mother of the boy was absolutely shocked to see her son laughing through a procedure that was so uncomfortable."

—*Certified Child life therapist at
Miller Children's & Women's Hospital Long Beach, CA*

"We have an oncology patient, and he challenges all of us. Trying to get him to participate in physical therapy [is] awful. Screaming, yelling, biting, kicking, punching. [With SpellBound] we were able to get him through the entire PT session to get him to stand, which he was refusing to do, and got him to actually take steps. We moved through all of the SpellBound cards that I had in my pocket and were able to get through **what normally would have been a 2 hour session in about 10 minutes** with the cards. It's pretty remarkable to see what SpellBound can do... it's a tool I use all the time."
