

# StableDRIVE

AN ENVIRONMENTALLY-FRIENDLY, PERMEABLE PAVING RANGE

## StablePAVE PRO

Fully interlocking gravel grid.

### WHAT IS IT?

StablePAVE PRO is a purpose designed, fully interlocking honeycomb structure for the stabilisation, containment and reinforcement of natural gravel surfaces. It is the most robust of the StableDRIVE product group and can be used in all light vehicular and pedestrian applications, including constant access commercial or municipal car parking.

StablePAVE PRO is produced in panels of 1.18 x 0.944 mtr x 32mm deep (1.1 sq. metres per panel), with a solid perforated base. This solid base, together with the secure interlocking facility provides immense stability and enhanced lateral loading resistance.

### LOW CARBON FOOTPRINT (Breem compatibility):

StablePAVE PRO is manufactured in the UK from 100% UK sourced re-cycled raw materials. The product can be fully re-cycled in itself, which leads to an ultra-low carbon footprint in production, use and disposal.

When used with traditional local, natural aggregates, the StablePAVE PRO system offers a significant contribution to beneficial BREEAM ratings in the landscaping and external works around your building. The contribution can be further enhanced by the utilisation of re-cycled decorative aggregates.

### PRODUCTIVITY:

The system is fast and easy to install, which is a major cost consideration, when compared to the alternatives. Installation rates of up to 250 sq. metres per day with a single small crew are achievable, making StablePAVE PRO a very economical paving selection.

### WHAT DOES IT DO?

StablePAVE PRO provides a free draining permeable paving layer. The reinforcing structure prevents rutting, restricts gravel migration and can withstand a compressive loading of over 280 tonnes/sq. mtr. The design criteria is to accommodate heavier vehicles up to and including emergency and utility access.

Addition lateral load resistance from the interlocking design makes StablePAVE PRO particularly suitable for heavy small wheeled maintenance or utility plant, horse boxes and other high point loading wheeled vehicles.

### SUDS (Sustainable Drainage):

Even with a traditional compacted sub base the system creates a free draining, permeable paving layer which virtually eliminates surface water run-off. This substantially reduces demand on surface water drainage capacity.

StablePAVE PRO is eminently suitable for use in conjunction with fully permeable sub base construction and over water harvesting installations.
