PRODUCT CLEANING  
& AFTERCARE

# PRODUCT CLEANING & AFTERCARE

---

## DAILY CARE FOR ALL FINISHES

- Regular cleaning will reduce the formation of limescale and water marks.
- After use wipe with a soft cloth and mild soapy water; rinse with clean water then dry with a soft cloth.
- Do not use abrasive cleaners or abrasive pads.
- Do not use harsh cleaning agents containing alcohol, bleach, acids, vinegar, ammonia or antibacterial ingredients.

## LIVING FINISHES

With the exception of Chrome all Lefroy Brooks finishes should be considered 'Living Finishes'. These have no protective coating and form a natural patina that will age naturally. The surface patina will darken in areas that are infrequently handled and appear highlighted in those that are frequently handled. Never rub Satin or Brushed finishes as this will damage the surface.

## PRECIOUS METALS

Gold is a soft metal that can easily be damaged by cleaning products and be depleted by excessive rubbing, even with a soft cloth.

## LIMESCALE

We recommend the occasional application of Beeswax or 'Autoglym Aqua Wax', a motor car product available from most car accessory shops. This will help to protect the surface and help resist the formation of limescale.

If limescale has been allowed to form use a mild non-abrasive proprietary limescale cleaner which does not contain bleach. Always check for suitability with the finish to be treated. Always follow the manufacturer's instructions and always test in an inconspicuous area first.

## XO GENEVA

The Geneva finish has a brushed surface. If marks have appeared the surface may be wiped lightly with a Scotchbrite pad. Care should be taken to wipe in the same direction as the grain. This may cause a slightly lighter surface colour but will match after a period of time as the newly scoured surface ages.

## POLISHED BRASS

Polished Brass can easily be scratched, scuffed and damaged by cleaning products. Abrasive cleansers, pads, cloths and scourers will damage the finish.

Discolouration, if unwanted, may be removed with the application of suitable metal polish. We recommend the use of metal polish supplied with wadding as this tends to be less abrasive. Please note that most metal polishes can damage the surface finish and cause scratches. Always ensure that the surface has been cleaned prior to the application of metal polish. We do not accept responsibility for any damage caused by polishing. It is important to clean the surface thoroughly after polishing to remove all residue.
