

## Head of Product Innovation – Job Description

---

May 2016

How often do you think about your roof?

Probably never.

However, millions of families in slums and villages around the world think about their roof every single day, every single night and every single season of the year. These families are forced to live under hot, leaky, broken metal sheets. ReMaterials is the only company worldwide that is solving this global roofing situation.

After 2 years of research and successful fundraising, we are now aggressively expanding team and manufacturing to serve our overwhelming sales response. The newest chapter in our journey is setting up an in-house product design lab to develop the next generation of roofing.

### Job Description:

The lab will be full of materials to play with: Organic, synthetic, recycled and more, along with prototyping facilities. If you can see yourself creatively using and combining these materials and prototyping our next roofing material, then we want to talk to you.

Roofing doesn't sound sexy? How about:

- Thinking of it as a material and design innovation
- Working in a well-funded, fast paced startup with a small team of engineers and the founding team
- Creating a product that will be used by families in slums and villages immediately
- Designing a product that not only has revolutionary impact on their quality of life, but also on the roofing scape of the world

**If you want to join a passionate team and a mission-oriented company, contact us now!**
