Estimation of a Non-Negative Function (Larkin, 1969)

Chris. J. Oates

July 25, 2017
10. Concluding Remarks

“... We have been concerned with the problem of estimating a function $f(r)$, about which we are given a limited amount of experimental information.

Our information about $f(r)$ is of two kinds:

1. General properties, such as non-negativity, continuity and integrability of $f(r)$ and/or its derivatives.
   
   This information, which may be genuinely given or arbitrarily imposed, limits a priori the class of allowable solutions. ("prior")

2. Specific properties, in the form of a finite number of observations on $f(r)$.
   
   These observations may be thought of as linear or non-linear functionals of $f$, which limit a posteriori the sub-class $C$ to which $f$ can belong. ("likelihood")
10. Concluding Remarks

“... We have been concerned with the problem of estimating a function $f(r)$, about which we are given a limited amount of experimental information.

Our information about $f(r)$ is of two kinds:

1. General properties, such as non-negativity, continuity and integrability of $f(r)$ and/or its derivatives.
   This information, which may be genuinely given or arbitrarily imposed, limits \emph{a priori} the class of allowable solutions. ("prior")

2. Specific properties, in the form of a finite number of observations on $f(r)$.
   These observations may be thought of as linear or non-linear functionals of $f$, which limit \emph{a posteriori} the sub-class $\mathcal{C}$ to which $f$ can belong. ("likelihood")
In general, an infinite number of exact observations will be required in order to characterise a particular $f \in C$, an impossible requirement in a real, physical situation.

Thus, unless more assumptions are made, we can say no more about $f(r)$ than that it is a member of that sub-class of $C$ whose elements could have resulted in the given observations. ("ill-posed")

A way out of this unpalatable but incontrovertible dilemma is to express precisely any intuitive feeling we may have that certain members of $C$ are a priori more likely than others. ("regularisation via a prior")

This enables us to formulate a variational problem whose solution, roughly speaking, represents the a posteriori most likely member of $C$. ..." ("MAP estimation")
In general, an infinite number of exact observations will be required in order to characterise a particular \( f \in \mathcal{C} \), an impossible requirement in a real, physical situation.

Thus, unless more assumptions are made, we can say no more about \( f(r) \) than that it is a member of that sub-class of \( \mathcal{C} \) whose elements could have resulted in the given observations. (\textit{“ill-posed”})

2. The Particular Example

Radiating cylinder of plasma

Observe the quantities

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} r \, dr \]

for \( j = 1, \ldots, m \).

Task: Recover \( f \). ("ill-posed")
2. The Particular Example

Radiating cylinder of plasma

Observe the quantities

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} r \, dr \]

for \( j = 1, \ldots, m \).

Task: Recover \( f \). ("ill-posed")

for $j = 1, \ldots, m$.

Task: Recover $f$. ("ill-posed")
5. A Relative Likelihood for Functions

**Entropy of radiation dist.**

The relative likelihood

\[ \mathcal{L}(f) := \int_0^R f(r) \log f(r) \, rdr \]

(“prior”) leads to a variational problem

\[ \text{arg min} \, \mathcal{L}(f) \quad \text{s.t.} \]

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2-x^2}} \, rdr \]

(“MAP estimation”)

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

**Entropy of radiation dist.**

The relative likelihood

\[
\mathcal{L}(f) := \int_0^R f(r) \log f(r) \, r \, dr
\]

(“prior”) leads to a variational problem

\[
\arg \min \mathcal{L}(f) \quad \text{s.t.}
\]

\[
\varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} \, r \, dr
\]

(“MAP estimation”)

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

Entropy of radiation dist.

The relative likelihood

\[ \mathcal{L}(f) := \int_{0}^{R} f(r) \log f(r) \, r \, dr \]

("prior") leads to a variational problem

\[ \arg \min \mathcal{L}(f) \quad \text{s.t.} \]

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} \, dx \int_{x}^{R} \frac{f(r)}{\sqrt{r^2-x^2}} \, r \, dr \]

("MAP estimation")

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

*Entropy of radiation dist.*

The relative likelihood

$$L(f) := \int_0^R f(r) \log f(r) \, r \, dr$$

(“prior”) leads to a variational problem

$$\arg \min L(f) \quad \text{s.t.} \quad \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} r \, dr$$

(“MAP estimation”)

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

The relative likelihood

\[ L(f) := \int_0^R f(r) \log f(r) \, r \, dr \]

(“prior”) leads to a variational problem

\[ \arg \min L(f) \quad \text{s.t.} \]

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} \, r \, dr \]

(“MAP estimation”)

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

*Entropy of radiation dist.*

The relative likelihood

\[
\mathcal{L}(f) := \int_0^R f(r) \log f(r) \, rdr
\]

("prior") leads to a variational problem

\[
\text{arg min } \mathcal{L}(f) \quad \text{s.t.} \quad \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} \, rdr
\]

("MAP estimation")

Can prove that the argmin is non-negative (but fiddly).
5. A Relative Likelihood for Functions

But, whilst the Abel transform

$$\psi(x) = 2 \int_x^R \frac{f(r)}{\sqrt{r^2 - x^2}} r \, dr$$

recovered in this way is smooth, the function $f(r)$ is not - against physical considerations.

Fig. 3. Results from the 1st formulation.
5. A Relative Likelihood for Functions

But, whilst the Abel transform

\[ \psi(x) = 2 \int_{x}^{R} \frac{f(r)}{\sqrt{r^2 - x^2}} r \, dr \]

recovered in this way is smooth, the function \( f(r) \) is not - against physical considerations.
7. The Second Formulation

Square root transform:

\[ f(r) = h(r)^2 \]

The relative likelihood

\[ L(h) := \int_0^R \left( \frac{dh}{dr} \right)^2 r \, dr \]

(“prior”) leads to a variational problem

\[ \arg \min L(h) \quad \text{s.t.} \]

\[ \varphi_j = 2 \int_{x_j}^{x_{j+1}} dx \int_x^R \frac{h(r)^2}{\sqrt{r^2 - x^2}} r \, dr \]

(“MAP estimation”)
8. Functional Integration

Whilst the main contribution was MAP estimation, there is a hint toward Larkin 1972.

Namely, if $h$ is considered random then the integrals

$$2 \int_{x_j}^{x_{j+1}} dx \int_{x}^{R} \frac{h(r)^2}{\sqrt{r^2 - x^2}} r dr$$

are also random - their distribution is derived in Section 8, but relies on the mathematics (Gaussian measures on Hilbert spaces) that was in preparation in Larkin 1972...
