

Data Center Solutions

Netversity's experienced data center technicians will turn your data center mess

Into an IT masterpiece in 4 steps

Here are the 4 Steps to clean up your data center:

1. Trace

Each connection is traced from end to end to identify the connectivity and the overall switch port capacity, including identification of the hardware.

This process is completed carefully and meticulously ensuring all devices stay online.

2. Identify Requirements

The length, colour and type of each patch cord is identified. If additional or replacement cables are necessary, it is established in this step

Determine whether cable management, power management or other forms of cable containments are required

Determining solutions to maximize energy use, on a raised floor using heat mapping technology.

Network rack and stack in final resting position to enhance device management

3. Document

A switch port data sheet is created for each network closet to document cable information, port information and device details

A new labeling scheme is created and sent to customer for approval

All patch cords are labeled following Industry Standards

4. Patching

We work with your I.T. team to ensure that there is no disruption to your services

Each switch will be patched during off business hours

All cables will be properly managed and labeled accordingly

Future installs will become a simple and clean process!
(Your future installs will go from a tedious endeavor to an effortless task!)
