

Real Time Integration into Infor VISUAL

Manufacturing Inventory Accuracy All the Time

Super Quick Implementation Guarantee

17. Inventory Placement

Situate your heaviest product at the top of your pick location hierarchy so they get picked first – lightest at the bottom of your location hierarchy. When you generate your pick list and order it by lowest to highest pick inventory location you'll build the most stable pallet.

18. Dynamic Locations

Turn this feature on to allow a put away to a location that hasn't been assigned to that part. Provided the barcoding system tracks product by location it'll give the users flexibility to move product around and you'll get better space utilization of your warehouse.

19. Printing Barcode Labels

Always print off a few samples and do test scans in the actual application before doing a production print run. For example; the Work Order ticket # and labor codes have special pre-and post-ambls that need to be embedded into the barcode in order for VISUAL to understand them.

20. Training of the End Users

Don't wait for training day by the vendor. Involve them in use case testing, label design, system design, and training of other users.
