The patented RoofTrac® rail/clamp system installed with the TileTrac® attachment method provides an ideal solution for mounting on a concrete tile roof. TileTrac® reduces the possibility of broken tiles and leaking roofs, allowing the installer to make structural attachments to the roof rafter. RoofTrac® installed with TileTrac® allows the height of the solar support rails to be adjusted to compensate for uneven roofs.

Illustrated above is how the TileTrac® attachment seamlessly integrates with the RoofTrac® mounting system.

The RoofTrac® support rail was designed to conceal all attachment hardware. All connections are made inside the support rail hidden from view.

Fully integrated, and patented, clamping system actually changes the structural properties of the aluminum channel making it significantly stronger. This design allows solar modules to be installed at a lower profile to the roof providing a more aesthetically pleasing installation.

Module end clamps are specifically designed for each specific module frame.
The patented RoofTrac® rail/clamp system installed with the FastJack® attachment method provides an ideal solution for installations where a flashing is desired. The FastJack® is also the solar industries preferred method of attachment for new construction roofs.
