RELIABLE METHODS TO MEASURE TEMPERATURE

THE TAKING OF BODY TEMPERATURE: Changes in body temperature is one of the most important indicators of illness. It is important that accurate temperatures be taken. Even though the digital thermometer is used in various manners, it is important that the simple instructions for use of this thermometer be followed closely and that the sensor bearing the temperature be temperature.

BODY TEMPERATURE: A person's body temperature will usually be several tenths to one degree lower in the morning than it is in the late afternoon. Therefore, if your temperature is 99°F (37.6°C) in the morning, it will be closer to 98.5°F (36.9°C) in the late afternoon and still be normal. To determine what your normal body temperature is, you should take your temperature both in the early morning and late afternoon over several days. Children usually have the same normal temperature range as adults. A fever for both children and adults is typically defined as a temperature over 99.6°F (37.5°C) (oral reading). Exercise, excessive clothing, hot bath, hot weather, warm food and drink can cause mild elevations of up to 100°F (38°C) to 101°F (38.3°C). In oral temperature, if you suspect one of these to be the cause of an elevated reading, eliminate the possible cause and retain the temperature in a half-hour.

differences of 0.3°C to 0.5°C from actual temperature. Dispose of any used probe shield and store the unit in a safe place.
