The Principles of Environmental Justice ..... 54

# Characterizing Environmental Justice with Community Indicators

Characterizing communities is not a very simple task. What makes a community? Is it geography? Culture? Commerce? What constitutes a 'community' depends on the context. For example, in biology a community is a group of interactive living organisms sharing a populated environment. Socially, a community can be defined as a social unit of any size that shares common values. Politically, a community can be defined by the administrative boundaries that are accepted by residents on both sides and serve to organize the activities within those boundaries.

Political, or administrative, boundaries are useful when examining local conditions like economic activity, public health, and environmental health. Environmental Justice (EJ) has various meanings in relation to public policy, science, and philosophy (see pages 5, 6, & 7). However, EJ is also a *movement* – a social movement that advocates for identifying and mitigating for the uneven spatial distribution of burdens to those local communities that provide wealth to others in society yet receive far less in return. How do we know when a community is carrying more of the burden than others? One way is by looking at and comparing targeted social, economic and environmental statistics. Those communities that produce wealth by means of resource extraction from the earth yet do not share in the wealth that those resources produce can be labeled as Places of Injustice. Put another way, some places experience more environmental impact from private wealth production without sharing in the relative societal wealth. Environmental Justice can manifest itself on the landscape as Environmental Classism or Environmental Racism.

We recognize that natural resources are unevenly distributed across the planet. However, we believe that those communities that produce more (much more) than they consume should be rewarded for the production and compensated for the environmental impacts they endure.

Photo 1: The Keystone Generating Station, Shelocta, PA, Armstrong County.

**Natural resource wealth redistribution is prevalent in the USA and, like other forms of wealth redistribution, should be recognized as equally unjust to the communities that produce such wealth.**

Photo 2: Shale Drilling Pad Site, Crabtree, PA, Westmoreland County.

This report uses the county as the organizing unit to identify 'community'. We acknowledge that not everyone within a county shares the same economic, health, and environmental conditions, but the county unit does provide a very good unit of measurement to characterize and compare one county to another, or one county to the average of all other counties.

Pennsylvania consists of sixty-seven counties, each with various levels of budgetary discretion, regulation, and enforcement. The Center for Coalfield Justice (CCJ) intends for this visual report, with simple yet sound statistical analysis, to be a valuable tool in assisting decision-makers, local and state officials, and all concerned citizens to understand their own communities. This report does highlight the conditions of Greene and Washington Counties. However, the information in these pages can be used to identify and characterize any of the Commonwealth of Pennsylvania's sixty-seven counties.

CCJ believes that Environmental Justice can and should be identified in more ways than the merely poverty and race, as the PA DEP and the Federal Government do. There are many other Community Indicators that can be used to characterize EJ. That is why the indicators used in this report include a selection of various demographic, social, economic, and landscape data. The indicator data were chosen by CCJ staff members and the consultant in order to represent a cross-sectional perspective of the counties of the Commonwealth.

Thank you,

-The Center for Coalfield Justice

# Community Indicators

The following text is an excerpt from, "Community Indicators", Rhonda Phillips. American Planning Association, Planning Advisory Service Report Number 517, Chicago. 2003.

Community indicators are measurements that provide information about past and current trends and assist planners and community leaders in making decisions that affect future outcomes. They can incorporate citizen involvement and participation. In essence, indicators are measurements that reflect the interplay between social, environmental, and economic factors affecting a region's or community's well-being.

**"Community indicators are bits of information that, when combined, generate a picture of what is happening in a local system. They provide insight into the overall direction of a community: whether it is improving, declining, or staying the same, or is some mix of all three (Andrews 1996; Redefining Progress 1997). A combination of indicators can therefore provide a measuring system to provide information about past trends, current realities, and future direction in order to aid decision making (Hart 2003; Oleari 2000). In this sense, community indicators can also be thought of as grades on a report card that rates community well-being."**

**-Rhonda Phillips, "Community Indicators", American Planning Association, Planning Advisory Service Report Number 517, Chicago. 2003.**

Policy makers have long used sets of information to aid in the decision making process, just as Community activists have used data to mobilize opinions so as to influence change. But as mentioned above, what today are called community indicators did not enter into use until around 1910 when the Russell Sage Foundation employed "over two thousand local surveys taken on education, recreation, public health, crime, and general social conditions" to assess social conditions (Cobb and Rixford 1998, 7). The first survey was conducted in Pittsburgh, Pennsylvania. Many of the surveys used by the Sage Foundation were conducted by nonprofit organizations, such as chambers of commerce and citizen committees. These surveys yielded social trends indicators and were popular until the Great Depression and World War II, when economic measures such as the gross domestic product or gross national product indicators took greater precedence.

In the late 1980s and early 1990s, advocates for indicator systems turned their attention to quality-of-life and overall community measures, incorporating concepts of well-being from economic, social, and environmental perspectives (Sawicki and Flynn 1996). During the 1990s, the emergence of the sustainability movement gave community indicators a new role in planning, policy, and citizen participation. The ideas behind and applications of community sustainability have been called a

"virtual social movement," one that citizens and other stakeholders, private foundations, public agencies, and nonprofit national and international organizations have eagerly embraced (Innes and Booher 2000).

# The Origins of Environmental Justice

The following text is an excerpt from, "Not in My Backyard: Executive Order 12,898 and Title VI as Tools for Achieving Environmental Justice. U.S. Commission on Civil Rights. 2003

Environmental justice is the "fair treatment of people of all races, income, and cultures with respect to the development, implementation and enforcement of environmental laws, regulations, and policies, and their meaningful involvement in the decision-making processes of the government."<sup>1</sup> The first environmental justice cases were brought in 1979 in Texas and in 1982 in North Carolina. In 1979, residents of Northwood Manor in East Houston alleged that the decision to place a garbage dump in their neighborhood was racially motivated in violation of their civil rights under § 1983 of the Civil Rights Act.<sup>2</sup> The district court in *Bean v. Southwestern Waste Management Corporation* found that the placement of the dump would irreparably harm the community.

The court specifically found that the landfill would "affect the entire nature of the community, its land values, its tax base, its aesthetics, the health and safety of its inhabitants, and the operation of Smiley High School, located only 1700 feet from the site."<sup>3</sup> Unable to establish intentional discrimination with sufficiently particularized statistical data showing a pattern or practice of placing waste facilities in communities of color, and unable to provide the court sufficiently detailed factual information on the siting decision, the residents were not granted relief and the plant was built.<sup>4</sup> The case, however, launched the use of the courts as a tool for the new movement and highlighted the need for data collection and access to information by communities challenging environmental decisions.

<sup>1</sup> Christine Todd Whitman, administrator, U.S. Environmental Protection Agency, memorandum to Assistant Administrators et al., "EPA's Commitment to Environmental Justice," Aug. 9, 2001. See also Linda J. Fisher, deputy administrator, U.S. Environmental Protection Agency, testimony before the U.S. Commission on Civil Rights, hearing, Washington, DC, Feb. 8, 2002, official transcript, p. 46 (hereafter cited as February Hearing Transcript) (environmental justice goes beyond Title VI and includes how agencies interact with all communities to ensure that no community becomes an "environmental dumping ground" due to lack of resources to defend its environmental health); Barry Hill, director, Office of Environmental Justice, U.S. Environmental Protection Agency, Testimony, February Hearing Transcript, pp. 54-55 (involves ensuring the fair treatment of all people, including minority populations and low-income populations); National Environmental Policy Commission, *Report to the Congressional Black Caucus and Congressional Black Caucus Foundation Environmental Braintrust*, Sept. 28, 2001, p. 11; Louisiana Advisory Committee to the U.S. Commission on Civil Rights, *The Battle for Environmental Justice in Louisiana: Government, Industry, and the People*, September 1993, pp. 1, 3 (environmental justice is the "attainment of environmental rights for all and the end of environmental racism" or racial discrimination in environmental policy-making and unequal enforcement of environmental laws and regulations).

<sup>2</sup> See *Bean v. Southwestern Waste Mgmt. Corp.*, 482 F. Supp. 673 (S.D. Tex. 1979), *aff'd*, 782 F.2d 1038 (5th Cir. 1986).

<sup>3</sup> 482 F. Supp. at 677.

<sup>4</sup> *Id.* The court noted that census tract information, historical information on the placement of facilities, the number of permits granted and denied, the reasons for granting or denying permits, demographics shifts, and other information are important in establishing environmental justice violations. Much of this information was unavailable to the residents in *Bean*. *Id.* at 680.

**Environmental Justice (EJ) is... "disproportionately high and adverse human health or environmental effects on minority populations and low-income populations"**

**- William J. Clinton, "Federal Actions To Address Environmental Justice in Minority and Low - Income Populations" in Executive Order 12898 of February 11, 1994.**

Photo 4: The Hatfield's Ferry Power Station) Monongahela Township, PA, Greene County.

**"The *fair treatment* and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation and enforcement of environmental laws, regulations and policies. *Fair treatment means that no group of people, including racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences* resulting from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies (*emphasis added w/ italics*)."**

**- US EPA, "Guidance for Incorporation Environmental Justice Concerns in EPA's NEPA Compliance Analyses", 1998.**

# Environmental Justice and Society

Environmental Justice (EJ) is based on the principle that all people have a right to be protected from environmental pollution and to live in and enjoy a clean and healthful environment. EJ is the equal protection and meaningful involvement of all people with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies and the equitable distribution of environmental benefits.

The following section is an excerpt from, "Not in My Backyard: Executive Order 12,898 and Title VI as Tools for Achieving Environmental Justice." U.S. Commission on Civil Rights. 2003

## ENVIRONMENTAL JUSTICE AND ECONOMIC OPPORTUNITY

Despite the demonstrated health risks, locating waste and toxic facilities in minority and low-income neighborhoods is viewed, by some, as a welcome means of providing these communities economic opportunities.<sup>5</sup> Supporters of the economic benefit theory point to the experiences of Select Steel and Shintech, Inc., as examples. Both facilities relocated from minority communities after environmental justice challenges were raised. Select Steel promised to provide jobs in the economically disadvantaged community of Genesee County, Michigan. Community members, however, were concerned about the adverse health effects created by the Select Steel facility. Their protests, and challenges to the granting of a permit to Select Steel, forced the facility to relocate.

Many community and environmental advocates disagree that jobs are being created for the communities exposed to the greatest health risks.<sup>6</sup> Chemical plants and other facilities, they note, do not hire local residents.. There are many cases that document the lack of jobs available when these types of facilities move into an area.<sup>7, 8, 9</sup> Additionally, the data reflects that when better paying, skilled jobs are created they often require skills not present in the workers from the immediate community.

For the jobs that are created, local residents are not given the right of

Photo 5: Electricity Transmission Towers, German Township, Fayette County.

**Currently there is no presumption of adverse health risk from multiple exposures, and no policy on cumulative risk assessment that considers the roles of social, economic, and behavioral factors when assessing rate.**

Photo 6: Natural Gas Transmission Pipeline, Dunbar Township, PA, Fayette County.

first refusal or guaranteed access to training to prepare them for available jobs.<sup>10</sup> In fact, EPA lacks legal authority to ensure that members of affected communities qualify for jobs created by a siting or permitting decision, and does not have authority to condition approval of state programs on their hiring practices.<sup>11</sup> EPA does not maintain records of which state regulatory bodies condition permits on specific hiring practices, or the reasons for such conditions if they are imposed by the states.<sup>12</sup>

<sup>5</sup> John K. Carlisle, *Economic Opportunity and Social Issues Trump Environment as Top Concerns for Poor and Minorities* (National Center for Public Policy Research, September 2000).

<sup>6</sup> Peggy Shepard, executive director, West Harlem Environmental Action, Inc., Testimony, January Hearing Transcript, p. 149 ("communities that bear the brunt of these facilities are not getting the jobs" and continue to experience high unemployment rates).

<sup>7</sup> Luke Cole, director, California Rural Legal Assistance Foundation, Testimony, February Hearing Transcript, p. 30.

<sup>8</sup> Elizabeth Teel, deputy director, Environmental Law Clinic, Tulane Law School, "Environmental Justice in Louisiana," written statement delivered to the U.S. Commission on Civil Rights, Washington, DC, Jan. 11, 2002, p. 13.

<sup>9</sup> See U.S. Census Bureau, 2000 Census.

<sup>10</sup> Elizabeth Teel Testimony, deputy director, Environmental Law Clinic, Tulane Law School, Testimony, January Hearing Transcript, p. 118 (people in these communities do not have the skill levels required to work in the facilities).

<sup>11</sup> EPA, Response to Interrogatory Question 43. See also Peggy Shepard, executive director, West Harlem Environmental Action, Inc., Testimony, January Hearing Transcript, p. 149 (companies do not ensure local residents employment at neighboring plants or facilities).

<sup>12</sup> EPA, Response to Interrogatory Question 43.

## ENVIRONMENTAL JUSTICE AS SOCIAL JUSTICE

Clearly, class and race play significant roles in environmental decision-making; moreover, communities of low-income and color are disproportionately affected by siting decisions and the permitting of facilities. Siting and permitting decisions are not, however, the sole sources of environmental concerns in these communities. Exposure to poor air quality, impaired drinking and surface waters, diesel emissions, noise, odor, and other pollutants also diminishes the health of these communities.

Low-income and minority communities are most often exposed to multiple pollutants from multiple sources; however, there has been insufficient data collection and scientific research identifying the health risks created by these multiple exposures. Additionally, there is no presumption of adverse health risk from multiple exposures, and no policy on cumulative risk assessment that considers the roles of social, economic, and behavioral factors when assessing risk.

# Manifesting Environmental Justice

Environmental Justice Areas of Concern are expanding in the Commonwealth (see Figures 1, 2 and 3, right). The Commonwealth of Pennsylvania's Department of Environmental Protection (PADEP) identifies Environmental Justice areas this way:

**An EJ area is any census tract where 20 percent or more individuals live in poverty, and/or 30 percent or more of the population is minority (based on the most current census tract data from the U.S. Census Bureau and the federal guidelines for poverty).**

- PA Department of Environmental Protection.  
[http://www.portal.state.pa.us/portal/server.pt/community/pa\\_environmental\\_justice\\_areas/20991](http://www.portal.state.pa.us/portal/server.pt/community/pa_environmental_justice_areas/20991)

In 2005, 666 census tracts met the PADEP definition of an EJ areas (Fig.1) for a combined 898 square miles . By 2010, the census tracts meeting the PA DEP definition of an EJ area (Fig. 2) had increased to 851 (a 22% increase) and then accounted for 2,379 square miles (a 62% increase).

This expansion of EJ areas from 2005 to 2010 in the Commonwealth of Pennsylvania then represented a combined increase of 1,481 square miles, which is approximately 5% of Pennsylvania's total land area (Fig. 3).

## Methods of this Report

All indicators were compiled from various sources and analyzed and displayed using a Geographic Information System (GIS). Z scores were compiled for each indicator. A 'Z Score' is the number standard deviations an observation is above or below the mean (average). Standard deviation shows how much variation exists from the average. Positive Z scores represent values above the mean, and negative scores represent values below the mean.

Fig.1 – PA DEP Environmental Justice Areas (2005)

Fig.2 – PA DEP Environmental Justice Areas (2010)

Fig.3 – Increases (red) in EJ areas from 2005 & 2010

Data Source: PA Department of Environmental Protection

Z scores are calculated as follows:

$$z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Using the Z Scores on each page you can:

- Identify a particular County as above or below the mean (+ or -)
- Determine how far away from the average a county is (standard deviation labeled as 'Z Score'), and
- See where a particular county ranks among the 67 Counties of Pennsylvania (Labeled as 'Z Score Rank')
- Identify counties that may have cumulative and/or multiple high scores, representing poor economic conditions or environmental impacts.

**'Cumulative and/or multiple exposures' mean exposure to one or more chemical, biological, physical or radiological agents across environmental media (e.g., air, water, soil) from single or multiple sources, over time in one or more locations, that have the potential for deleterious effects to the environment and/or human health.**

-Council on Environmental Quality, "Environmental Justice Guidance Under the National Environmental Policy Act". 1997.

In each table on the pages that follow, some indicators were ranked with an inverse Z score by multiplying the score by -1. This was necessary because most indicator scores that are positive indicate a less-desirable ranking. However, some less-desirable scores were ranked with a negative score. Those indicators that were reverse-coded were: population growth, birth rates, RNI, homeownership, housing value, voter participation, federal expenditures, and per student spending. This necessary for calculating the composite scores.

Data that are two standard deviations below the mean will have a Z-score of -2, data that are two standard deviations above the mean will have a z-score of +2. Data beyond two standard deviations away from the mean will have z-scores beyond -2 or 2. **Data beyond two standard deviations away from the mean are considered unusual data.**

# CCJ's Environmental Justice recommendations for **Action**

## Environmental Justice Is Achieved When All People Can Realize Their Highest Potential, Without Interruption By Environmental Inequity.

Environmental Justice is supported by decent paying and secure jobs; quality schools and recreation opportunities; decent housing and adequate health care; democratic decision making about permitting, regulating, and enforcement; and finally, personal empowerment. We believe that every community in Pennsylvania has the potential to generate healthy jobs, reduce and prevent industrial pollution, develop affordable housing, preserve local resources, and conduct community-led planning to sustain a vibrant future. This vision can become a reality by identifying the communities most burdened by environmental injustices and creating policy that follows community priorities.

## The Information In This Report Brings Into Focus A Clear Contradiction.

With its resource rich earth and productive labor, Greene and Washington County continuously offer a bounty of coal and natural gas to meet the energy needs of this nation and other countries. But, in Washington and Greene Counties the rate of poverty is high; home ownership and recreational opportunities are decreasing; child abuse, crime, school dropout rates, and the number of vacant homes are increasing; and problematic air and water quality contribute to a decrease in property value and ill health of local residents.

## By Documenting Disparities And Highlighting The Conditions Of Those Most Affected, We Hope To Offer A New Forward-looking Approach.

This approach takes into account cumulative exposure and social vulnerability, and a new set of policies that stress prevention rather than mitigation, inter-agency coordination, and enhance the participation of community members in decision-making processes. After all, Greene and Washington Counties - with their beautiful natural resources and hard-working people - deserve protection from harm and damage, assurance that an environmental of quality will be preserved for future generations, and diverse economic opportunity.

### THREE PRINCIPLES FOR ACTION:

- ✓ **Strive for Environmental Justice.** *Actions should reduce cumulative impacts on the most affected and vulnerable communities.*
- ✓ **Action should reduce risk.** *The burden of proof should be on those proposing the activity. Regulatory agencies should utilize a precautionary, not reactive, approach in decision-making.*
- ✓ **Residents speak for themselves.** *Agencies must engage with residents of affected communities when making decisions about those residents' natural environment.*

## Moving Forward:

### Change Happens When We Work Together:

The Pennsylvania Department of Environmental Protection should focus on mechanisms to effectively incorporate Environmental Justice concerns into their decision-making. While these concerns may not provide the level of specificity to serve as the sole basis for permitting decisions (for example, it may not be a formal assessment of impacts), the profile of a community characterized by having high cumulative environmental impacts and high social vulnerability ought to raise the bar for permitting additional environmental hazards.

The Pennsylvania Department of Environmental Protection should expand the definition of what constitutes an Environmental Justice Area beyond just race and income/poverty.

Public agencies should actively engage with residents and advocates representing the most affected communities and document local conditions. This will allow community members and advocates to better understand the impacts they face, to work effectively with public agencies, and to develop innovative solutions for preventing or mitigating impacts.

Public agencies should produce an annual report card to track process towards improving conditions for the most vulnerable and most affected communities. This report card should also identify areas needing special consideration and resources. Finally, this report card should identify promising practices to adapt to other areas of the state.

Public agencies should work in a mutually beneficial partnership, not conflict, with community-based organizations and residents by creating programs like training for residents in specific monitoring techniques.

Public agencies should identify "Cumulative Environmental Action Zones" in order to prioritize support for specific areas within the region most burdened by environmental impacts and with the fewest social and economic resources to mitigate these impacts. Such support could include enhanced pollution abatement and mitigation funding, additional environmental and health monitoring, and special consideration in permitting decisions and enforcement actions.

To ensure that any action steps taken by public agencies match the lived realities of residents, the data and assumptions relied on in permitting, regulating, and enforcement must be publically available. Furthermore, agencies must provide meaningful opportunity for residents of affected communities to actually inform some of the specific indicators used in decision-making and contribute their knowledge of environmental impacts as they experience them.

Investments in regulatory and academic science would pay great dividends in creating better-informed and more democratic public policy. Financial and institutional support for programs developed through collaboration between academic researchers, community organizations, and public agencies focused on a specific area and/or environmental health issue could help inform the implementation and methodology of actions for real-time improvement.

Public agencies should invest in a biennial "Cumulative Environmental Assessment" in order to understand and, most importantly, to inform action on behalf of communities.

# Figure 4 - Coal Mining in Pennsylvania

June, 2013

## Coal Mining in Pennsylvania

Coal mining in Pennsylvania is found in the bituminous coal fields of the western part of the Commonwealth, and in the anthracite coal fields of the eastern and north eastern parts of the Commonwealth.

The purple area on Figure 4 (right) shows the extent of the Appalachian Bituminous Coal Region and the light pink shows the extent of the Pennsylvania Anthracite Coal Region. Within the Bituminous Coal Region, the previously mined Pittsburgh Coal Seam is shown as light orange, mostly in the counties of Allegheny, Fayette, Greene, Washington and Westmoreland. Within the Pittsburgh Coal Seam, the light yellow region shows where the Pittsburgh Coal Seam has not yet been mined and is economically practical to do so.

Using the latest coal mining operations permit data published by the PA DEP, Figure 4a (below) shows the density of permits issued per ten square miles. The majority of the coal mining operations in the Commonwealth are in the Bituminous coal regions, particularly in Butler, Clarion and Jefferson Counties.

**NOTE** – this analysis only shows how many permits are issued per 10 square miles – it does not take into account the size of individual coal mining operations. For example, the size of the operating longwall mines are not represented.

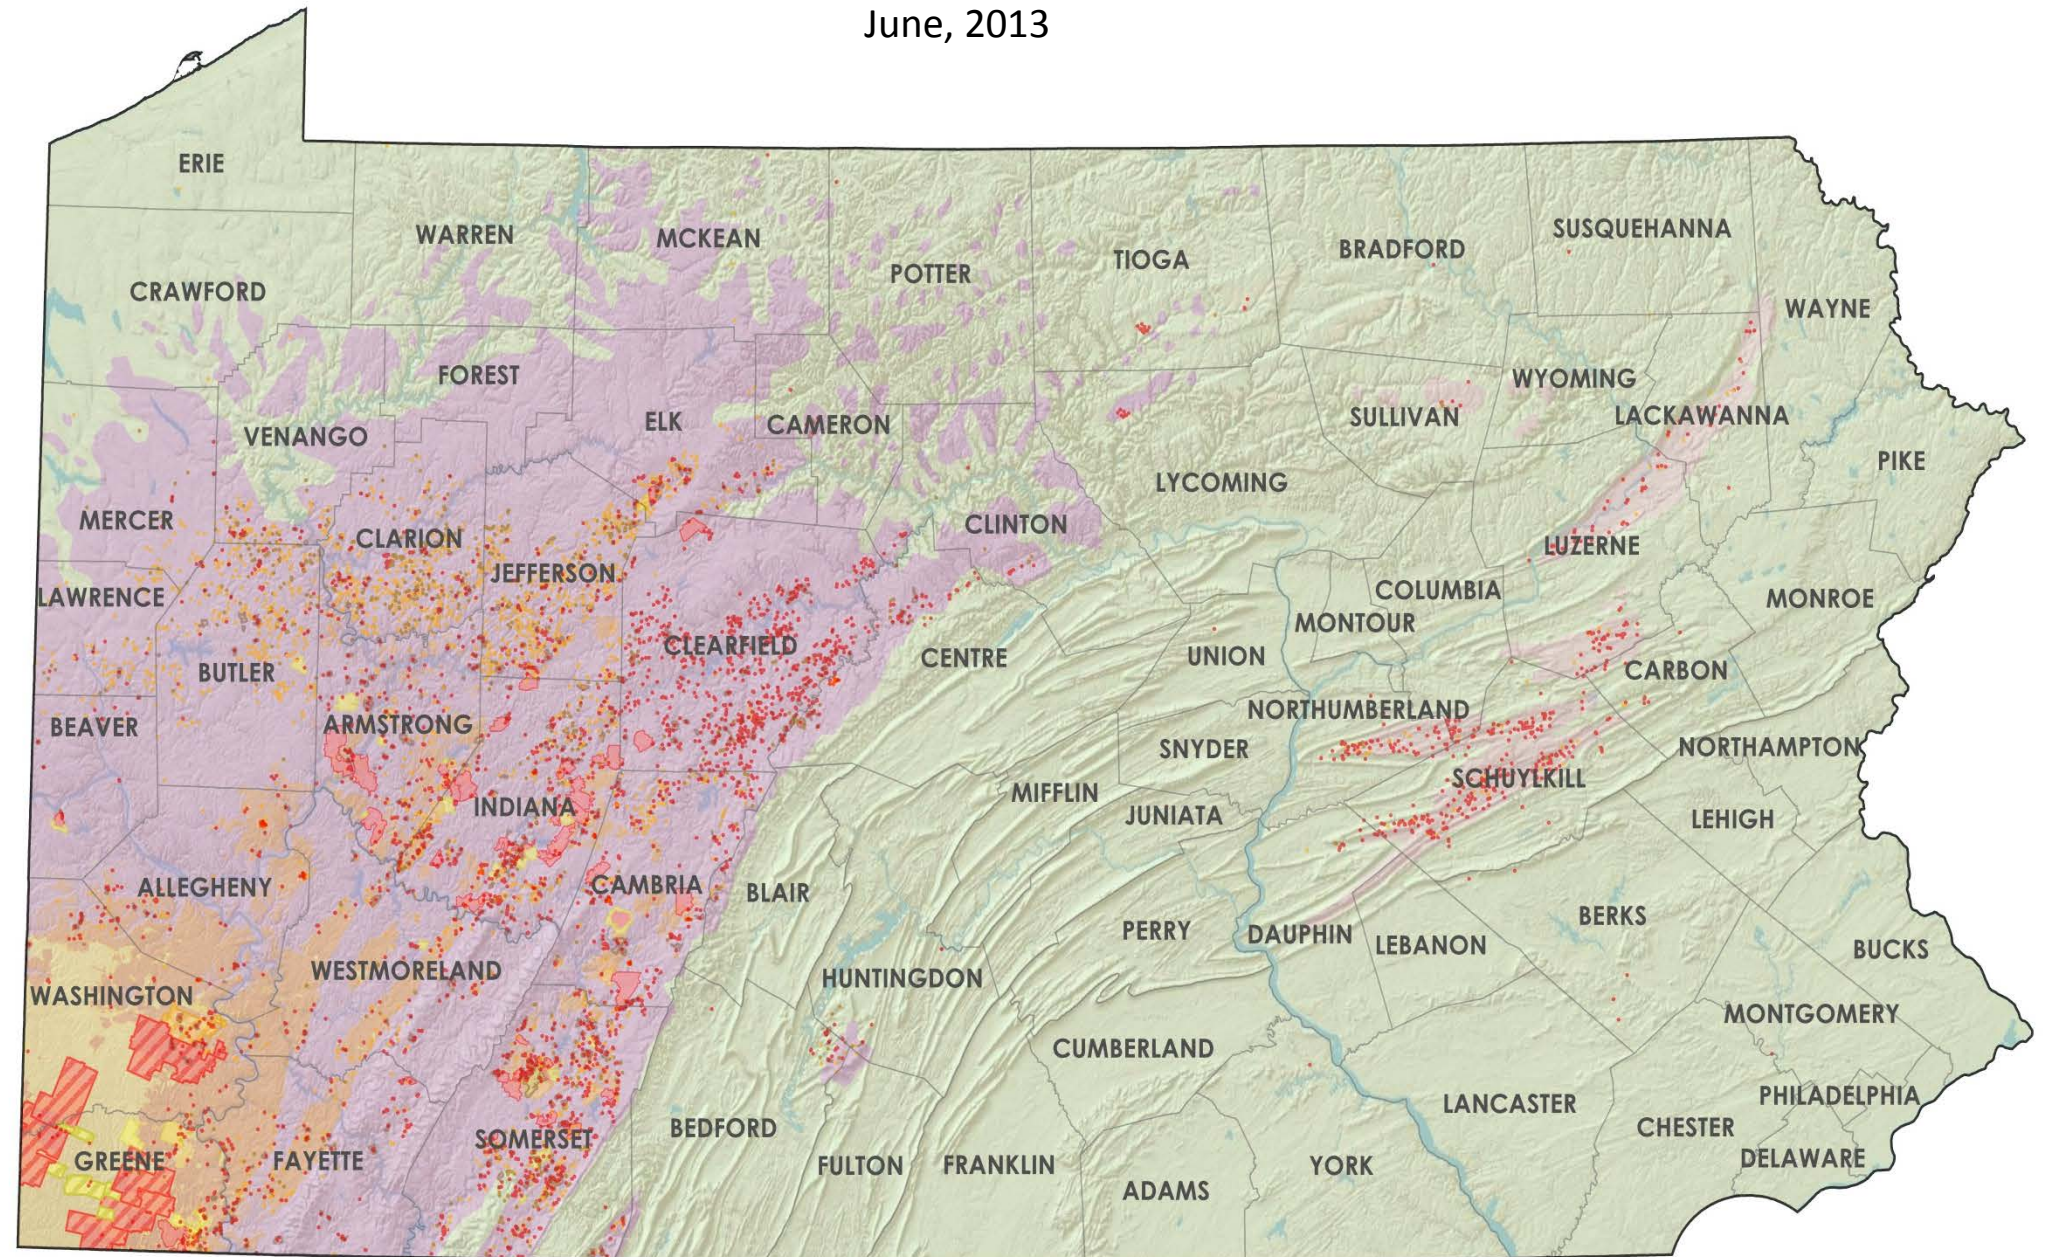

Fig.4a – Point Density of Coal Mining Permits per 10 Sq. Miles

# Figure 5 - Shale Drilling in Pennsylvania

July, 2013

## Shale Drilling in Pennsylvania

Shale drilling in Pennsylvania is currently found in the Marcellus Shale Formations found between 1,000 and 7,000 feet beneath the western, north central, and north east part of the Commonwealth and in the Utica Shale Formations of the eastern and north eastern parts of the Commonwealth. The Utica is typically 2,000 to 12,000 feet below sea level.

The purple cross-hatched area on Figure 5 (right) shows the extent of the Marcellus Shale Formation and the solid gold shows the extent of the Utica Formation. Other shale formations are also being explored for development that are above the Marcellus, below the Utica, and in between. The Marcellus Shale Formation lies beneath 52 of the 67 Counties of Pennsylvania. The Utica Shale Formation lies beneath 51 of the 67 Counties of Pennsylvania.

Using the latest unconventional (shale) gas well permit data published by the PA DEP, Figure 5a (below) shows the density of permits issued per ten square miles. There are two major clusters of Shale Drilling Activity in the Commonwealth, each with several minor clusters within them. Cluster 1 is in the north eastern part of the Commonwealth centered in Bradford and Susquehanna Counties and Cluster 2 is in the south western part of the Commonwealth centered in Greene and Washington Counties.

# Population - Growth (2000 - 2010)

Greene County has experienced the 7<sup>th</sup> largest population loss in PA from 2000 – 2010 (-4.9%). Washington County has had a population gain of 2.4% during the same time.

Rapid or severe changes in population growth rate may result in potential impacts to existing community or public services and infrastructure.

Changes in growth rate may include: (1) an relative increase in low-income or minority population(s) in an area (2) high or low birth rates, and (3) cumulative impacts due to multiple sources of population increases or decreases.

\*Please note the growth rate of Forest County. This growth is almost entirely due to the opening of the State Correctional Institution – Forest (SCI – Forest). SCI – Forest opened in 2004 to hold Maximum-Security male inmates. The prison population should be considered residents of the county, as they too could be subject to environmental risks.

- Z Score**
- < -1.5 Std. Dev.
  - -1.5 - -0.50 Std. Dev.
  - -0.50 - 0.50 Std. Dev.
  - 0.50 - 1.5 Std. Dev.
  - > 1.5 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, population growth is more desirable than decline. The Z score map (left) shows original Z scores.

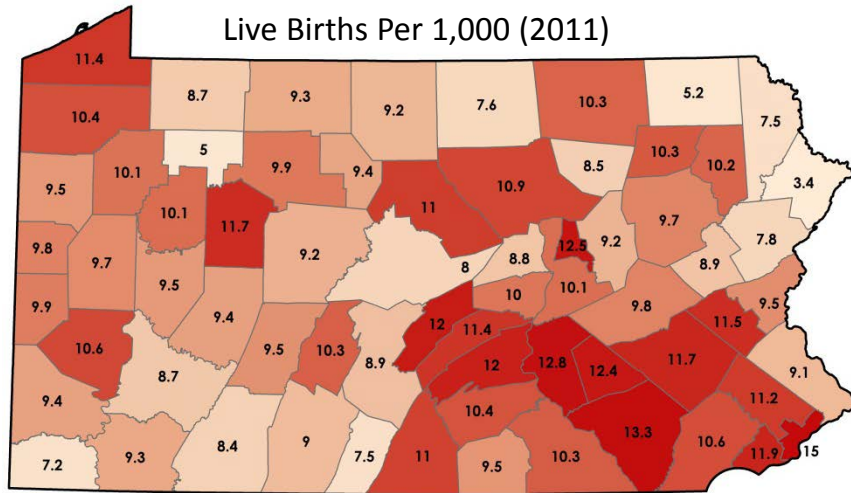

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Data beyond two standard deviations away from the mean is considered unusual data.

# Population - Birth Rates

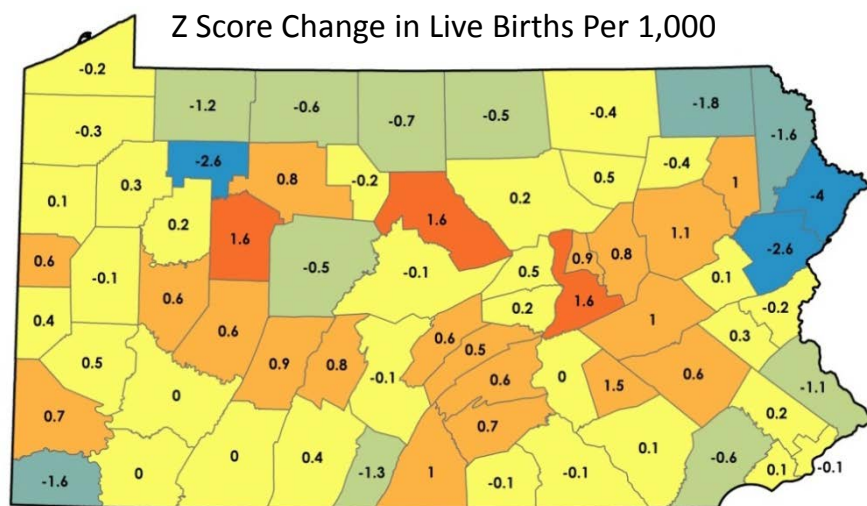

Greene County has experienced the 6<sup>th</sup> largest birth rate decrease in PA from 1991 – 2011 (-5.7%).

The birth rate is the total number of births per 1,000 of a population each year. The rate of births in a population is calculated in several ways: live births from a universal registration system for births, deaths, and marriages; population counts from a census, and estimation through specialized demographic techniques.

When the crude death rate is subtracted from the crude birth rate, the result is the rate of natural increase (RNI) (See pages 12 and 13).

The average change in birth rates for all 67 PA Counties during this period was -3.2%

## Z Score

- < -2.5 Std. Dev.
- -2.5 - -1.5 Std. Dev.
- -1.5 - -0.50 Std. Dev.
- -0.50 - 0.50 Std. Dev.
- 0.50 - 1.5 Std. Dev.
- 1.5 - 1.6 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, rising birth rates are more desirable than declining rates. However, birth rates are not used in determining summary scores. The Z score map (left) shows original Z scores.

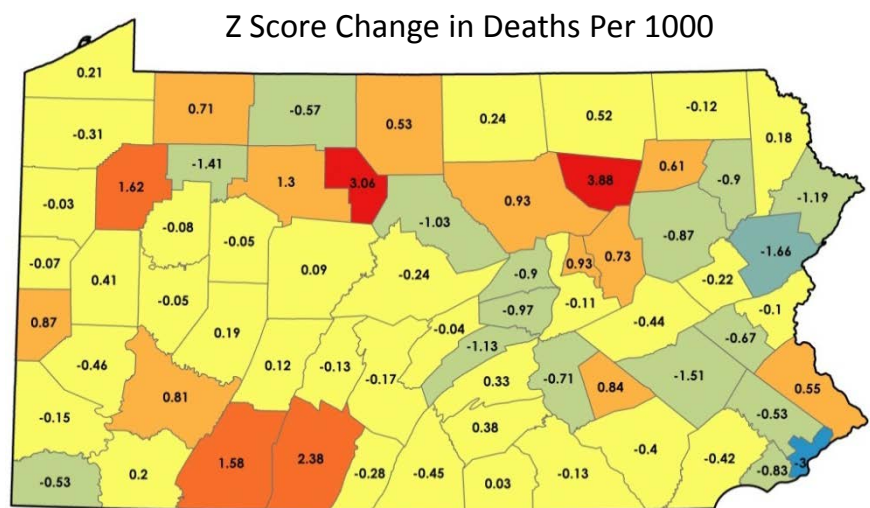

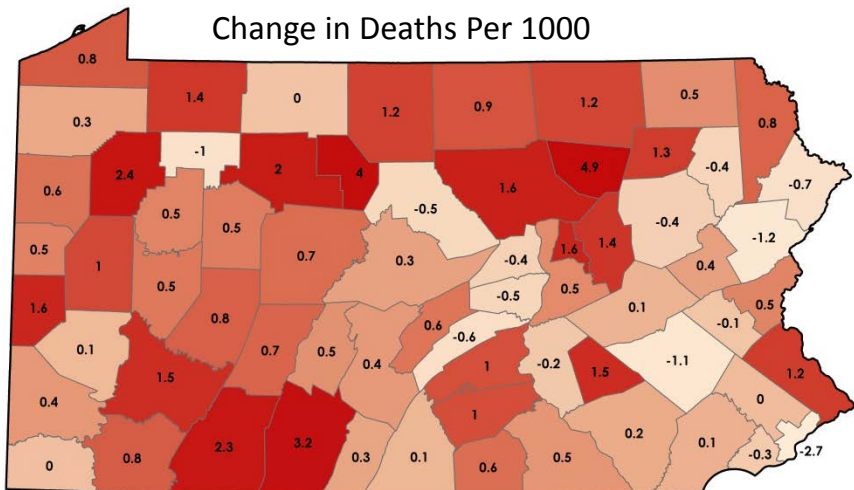

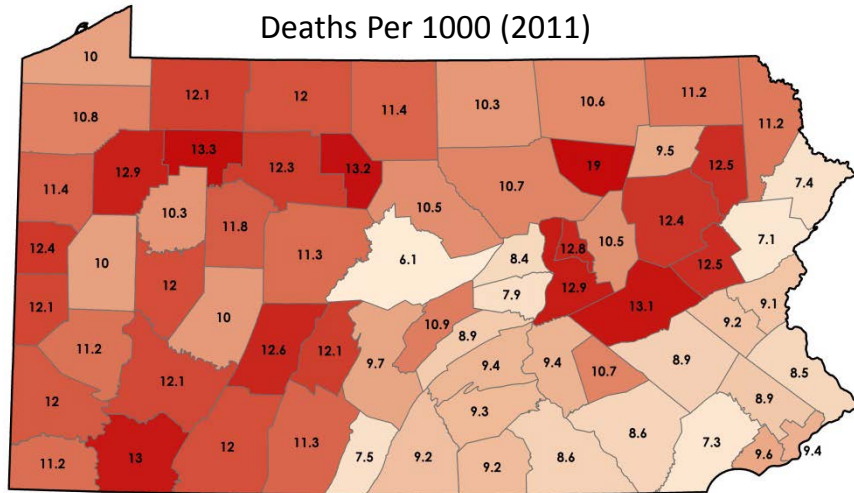

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Data beyond two standard deviations away from the mean is considered unusual data.

# Population - Mortality

Greene County's mortality rate has remained the same between 1991 – 2011 (11.2%). Washington County's mortality rate rose slightly (0.4%) during the same period.

Mortality rate is a measure of the number of deaths (in general, or due to a specific cause) in a population, scaled to the size of that population, per unit of time.

Mortality rate is typically expressed in units of deaths per 1,000 individuals per year; thus, a mortality rate of 9.5 (out of 1,000) in a population of 1,000 would mean 9.5 deaths per year in that entire population, or 0.95% out of the total.

It is distinct from morbidity rate, which refers to the number of individuals in poor health during a given time period.

# Population - Rate of Natural Increase (RNI)

Greene County had the 4<sup>th</sup> lowest RNI in 2011 (-4.1%). Washington County also experienced a negative rate (-2.6%). The PA average, by county, was -1.05.

The Rate of Natural Increase (RNI) is simply determined by taking the crude birth rate minus the crude death rate of a population. Used in demographics to better understand the developmental transitions of a population.

Populations in developed countries, like the USA, usually have negative / neutral or low natural increase rate.

However, populations that are farthest away from the mean may indicate other influences, such as immigration (increasing population) or a declining base (low births and high deaths).

### Z Score

- < -2.5 Std. Dev.
- 2.5 - -1.5 Std. Dev.
- 1.5 - -0.50 Std. Dev.
- 0.50 - 0.50 Std. Dev.
- 0.50 - 1.5 Std. Dev.
- 1.5 - 2.3 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, rising RNI is more desirable than declining RNI. The Z score map (left) shows original Z scores.

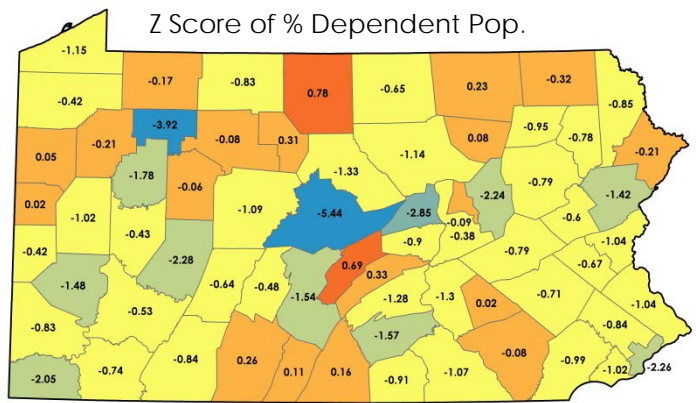

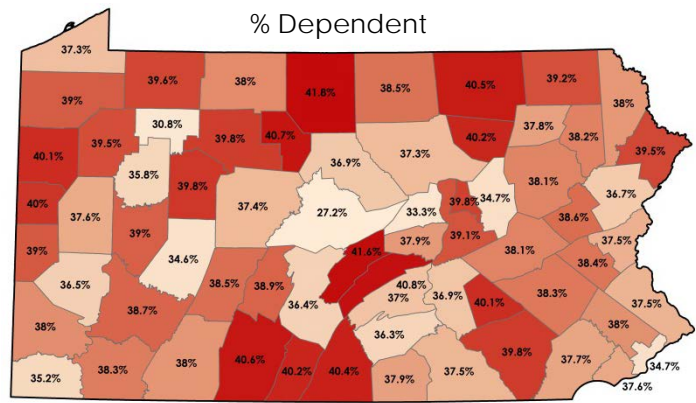

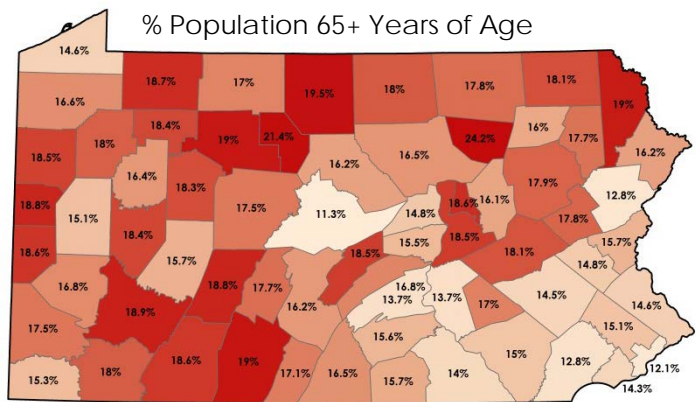

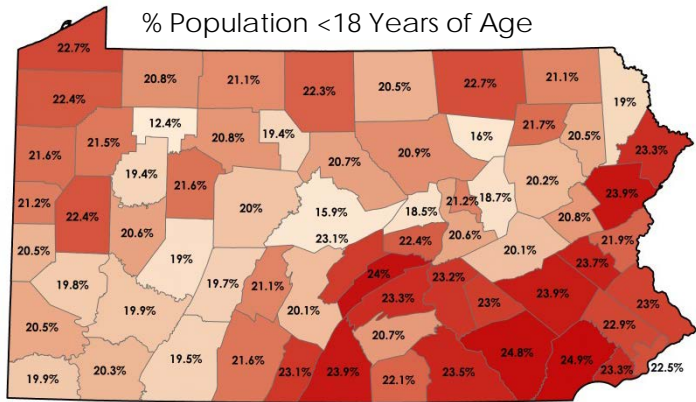

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Data beyond two standard deviations away from the mean is considered unusual data.

# Dependent Population - (under 18 and over 65 years of age)

Greene and Washington Counties have a relatively small dependent population (35% and 38%, respectively) when compared to the PA average of 40%. Greene is almost statistically unusual.

Dependent populations are usually calculated as those individuals in a population that are either under the ages of 18 or over the age of 65. These are generally the ages of populations out of the work-force.

Older or younger populations may be more susceptible to risks, when taking into account special health concerns of the elderly and potential for greater exposure in younger populations (e.g., ingestion of soil). In addition, children's immature bodily defense systems may make them more susceptible to toxic effects.

For these reasons, dependent populations are also sometimes considered populations most threatened by environmental impacts.

# Land Area & Population Density

Washington County had the 22<sup>nd</sup> highest population density (241 per sq. mile) amongst the 67 PA Counties. Greene County had the 51<sup>st</sup> highest population density (67 per sq. mile).

High population density may promote a synergistic effect between industrial pollutants and typical urban pollutants (e.g., ground level ozone), especially if industry is located in close proximity (5 miles or less) to high density populations.

Low population density may lead the environmental impact analyst to underestimate the actual environmental harm to the affected population when conducting a risk assessment.

County land area varies widely within Pennsylvania. Lycoming County is the largest county at 1,244 square miles. Montour County is the smallest county, measuring 132 square miles. The average county size in Pennsylvania is 676 square miles and the median county land area size is 665 square miles.

# Population - Race

The populations of Greene and Washington Counties are both composed of less than 7% racial minorities.

Understanding the racial structure of a population is a primary consideration when investigating environmental justice (EJ) concerns. The two fundamental baseline measurements when determining EJ matters is race and poverty / low income.

The data in the table shows the breakdown of race by self identification. The percent minority is the combined values of all races other than White (and includes two or more).

Both Greene and Washington are nearly 95% White. Please note that when adding % White and % Minority, the sum may equal more than 100%. This is due to some identifying as both White and Two or more.

# Substantiate Cases of Abuse per 1,000 Children

Greene County ranks 3<sup>rd</sup> in increase in substantiate child abuse cases with a 1.4% increase between 2009 – 2011, and the 2011 rate of 2.8% was significantly higher than the 1.7% state average.

Child abuse in the United States is defined as the maltreatment as in any act or series of acts of commission or omission by a parent or other caregiver that results in harm, potential for harm, or threat of harm to a child.

The Pennsylvania Child Protective Services Law (CPSL) requires that every year the Department of Public Welfare (DPW) report to the Governor and General Assembly on the problem of child abuse in the commonwealth.

This annual report provides information on the efforts to protect and help children in the Commonwealth of Pennsylvania who were reported as victims of suspected abuse and neglect.

# Serious Crimes per 100,000 Residents

Greene County experienced a crime rate increase of 169 serious crimes per 100,000 residents between 2009 – 2011. Washington County decreased by 94 crimes per 100,000 residents.

The Pennsylvania State Police Uniform Crime Report is an annual report of crime statistics for the Commonwealth of Pennsylvania. 'Serious Crimes' are Crime Index offenses under the Uniform Crime Report and include; criminal homicide, forcible rate, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft, and arson.

Crime Index offenses are considered to be both the most serious and most likely to be reported, and are used nationally as the standard base for comparisons.

The following are considered 'Part II' offenses, and are not counted in these numbers: other assaults, forgery and counterfeiting, fraud, embezzlement, stolen property, vandalism, weapons, prostitution, other sex offenses, drug abuse violations, gambling, offenses against the family, driving under the influence, liquor law violations, drunkenness, disorderly conduct, vagrancy, and all other offenses.

# Housing Stock Age

Greene County is ranked 18<sup>th</sup> out of 67 counties in PA for the highest % of homes over 70 years old.

Disproportionately aging housing stock can be indicative of a population that is at an economic disadvantage.

Older housing stock, if not properly maintained, may have building materials that may be harmful to human health, such as lead-based paints and asbestos insulation and flooring.

If neglected, older housing stock can have a synergistic effect with other risk factors.

# Housing Units - Type & Density (Average 2007-2011)

Greene and Washington Counties both have near the average amount of single-family homes.

A single-family home means that the building is usually occupied by just one household or family, and consists of just one dwelling unit. 'Detached' means that the building does not share an inside wall with any other dwelling.

The type and density of housing units can be used as indicators of regional economic structure, cultural variation, urban/rural places, and land-use practices.

Single family, detached dwellings are likely to use more energy for climate control, and residents are more likely dependent on private transportation.

# Homeownership (Average 2007-2010)

Greene County had the 8<sup>th</sup> highest decrease in homeownership in PA between 2007 – 2010 (-4.3%). Greene was slightly below the PA average of 73.4% owner-occupied units in 2010 with 72.5%.

According to the US Census Bureau, homeowners in the United States tend to have higher incomes, and households residing in their own home were more likely to be families (as opposed to individuals) than were their tenant counterparts.

Homeownership can also be an indicator of investment in a community. When a community has high homeownership rates, it can be a sign that the community will have more pride and cohesion. It can be an indicator that that community will have a stronger 'sense of place' than other communities with lesser homeownership rates. Communities with lower homeownership rates, and thus more renting, can be indicative of a community that is a less-stable community or one that is a transitional community.

Changes in homeownership rates can be an indicator of the future path a community is heading towards.

### Z Score

- < -1.5 Std. Dev.
- -1.5 - -0.50 Std. Dev.
- -0.50 - 0.50 Std. Dev.
- 0.50 - 1.5 Std. Dev.
- > 1.5 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, declining homeownership is less-desirable than increasing rates of homeownership. The Z score map (left) shows original Z scores.

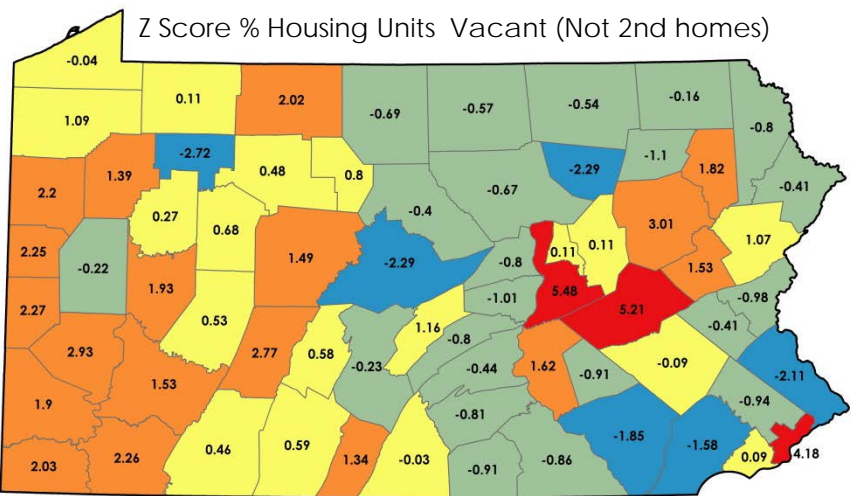

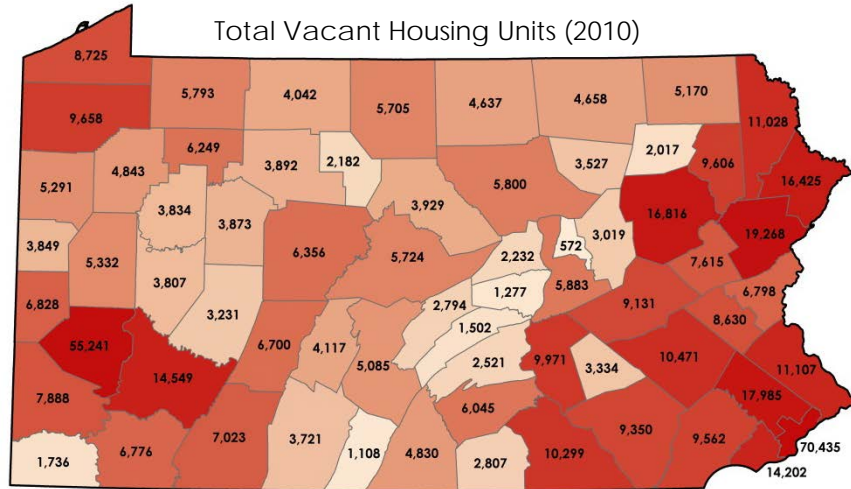

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

# Vacant Housing Units (Average 2007-2011)

Greene County and Washington County both had higher average housing vacancy rates from 2007-2011 than the PA average of 6%. Greene's rate approaches unusual.

The US Census Bureau collected vacancy rates of housing from the American Community Survey. Housing vacancy, along with rental vs. owner-occupied, are statistics that can be used to indicate transient, established, declining, or growing communities.

The values in the table shows a percentage of the total vacant housing unit value, but does not include those units that are seasonal, recreational, or used occasionally by the owner (i.e., second homes are not represented in the percent vacant). Not including second homes shows the characteristics of substance housing in communities.

Changes in housing vacancy rates, like homeownership rates, can be an indicator that a community is becoming less-traditional and more transitional.

# Housing Values

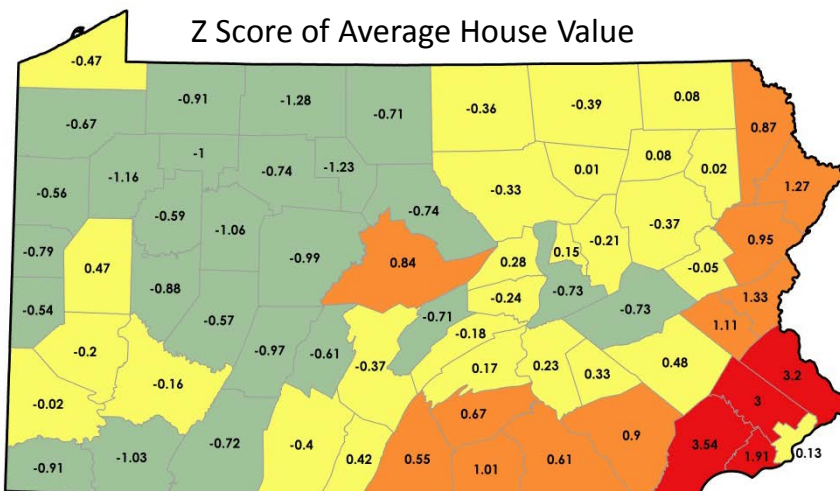

Greene County had the 9<sup>th</sup> lowest average house value in PA (2007-2011) after adjusting for inflation.

The US Census Bureau collected financial characteristics of housing from the American Community Survey. The value of home and property is an important measure of neighborhood quality, housing affordability, and wealth.

These values refer to owner-occupied single-family housing units on less than 10 acres without a business or medical office on the property.

These data are used by federal, state and local government agencies, the private sector, and researchers for activities such as; housing assistance plans for elderly and low-income households, transportation plans and programs, regional value variations, and analyses of housing needs.

- Z Score**
- < -0.50 Std. Dev.
  - 0.50 - 0.50 Std. Dev.
  - 0.50 - 1.5 Std. Dev.
  - > 1.5 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, declining home values are less-desirable than rising home values. The Z score map (left) shows original Z scores.

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

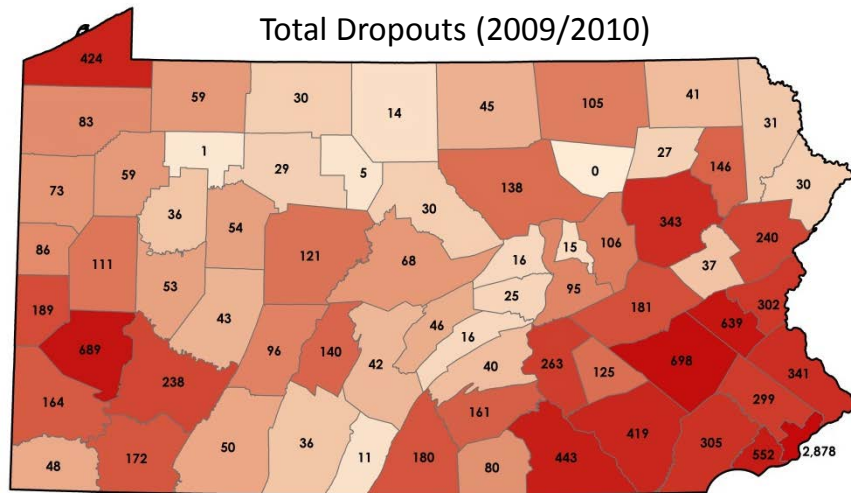

Data beyond two standard deviations away from the mean is considered unusual data.

# Public School Dropout Rate\*

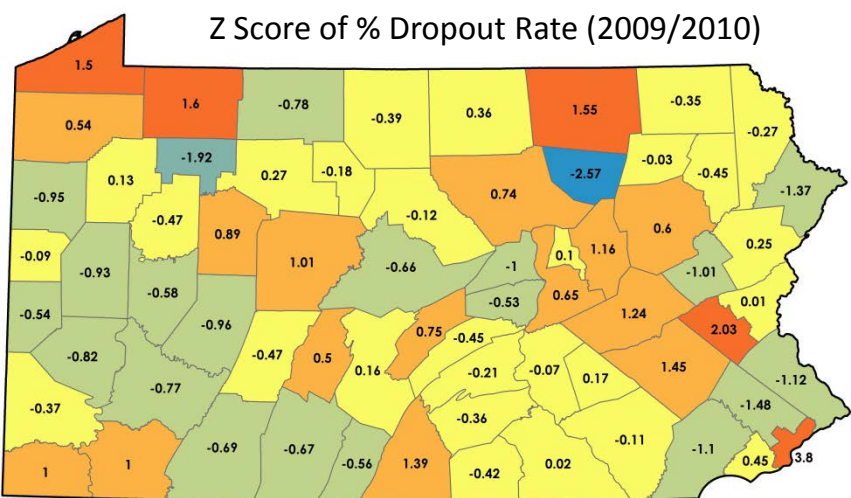

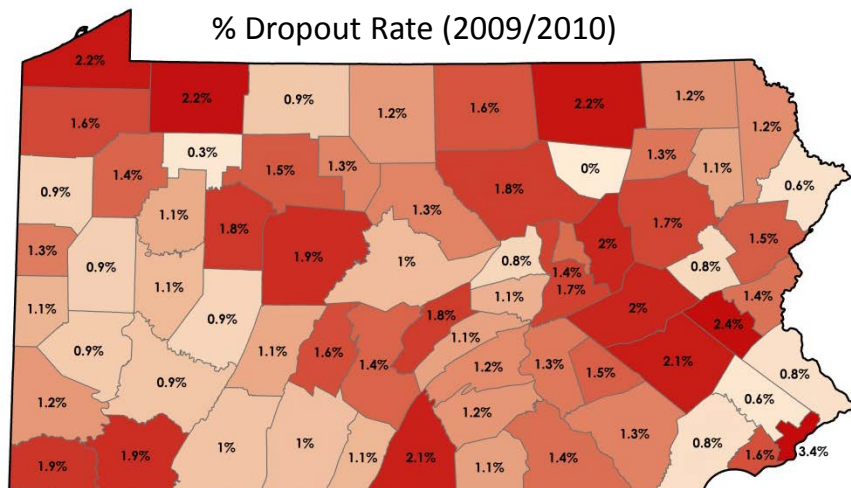

Greene County had the 12<sup>th</sup> highest public school dropout rate in PA (2009/2010).

This data shows the dropout rates for public school districts, aggregated by county.

\*These numbers reflect the fall enrollment in grades 7 through 12 and the total number of dropouts in those grades through a single school year.

When middle-school grade enrollments are withheld from the analysis, significant differences in the total dropout rates change.

The legal age for a child to dropout of school in Pennsylvania is 16, if the child holds an employment certificate.

# Voter Participation

Greene County has the 7<sup>th</sup> lowest voter participation average from 2000 -2012 in PA.

This data shows the percentage of voter participation by registered voters per county. Z scores are for voter – nonparticipation.

Voter turnout is declining in Pennsylvania. The percentage of registered voters voting in Presidential elections in Pennsylvania from 1960 to 2012 was 76%. The percentage of registered voters voting in Presidential elections in Pennsylvania from 2000 to 2012 was 67%.

Low turnout is often considered to be undesirable, as it indicates apathy in the political process and, perhaps most importantly, a small number of citizens decides who will represent everyone.

### Z Score

Data Sources: PA Dept. of State, Bureau of Commissions, Elections and Legislation. Voter turnout reflects number of votes cast for U.S President divided by the total number of persons 18 years old and older. <http://www.electionreturns.state.pa.us/>

# Federal Expenditures

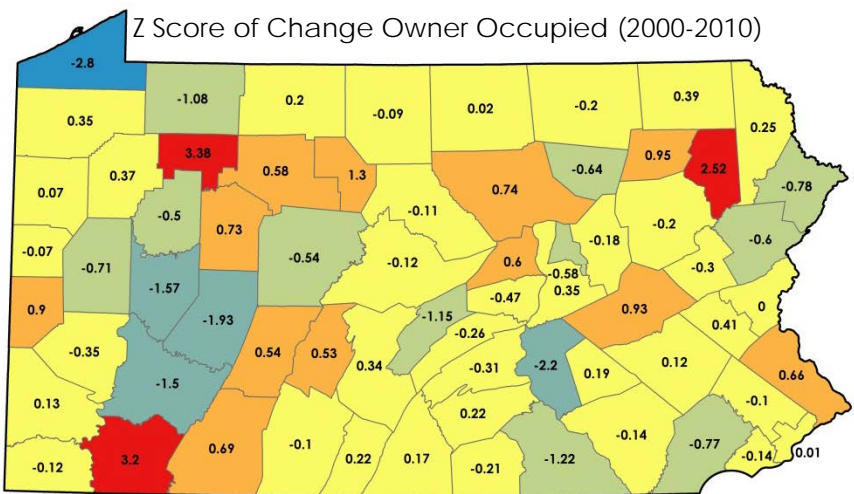

Washington County received an increase of 10.3% of Federal dollars from 2007-2010, and Greene County received an increase of 4.3% during the same time.

This data sums all of the Federal dollars for all programs spent in a county. Data are obtained on the amount of virtually all Federal expenditures, including grants, loans, direct payments, insurance, procurement, salaries and wages, and other awards (such as price supports and research awards). Data represent actual expenditures (or outlays) with some exceptions.

The Bureau of Economic Analysis, Office of Management and Budget, U.S. Congress, state governments, and private researchers use the data to measure and assess Federal expenditures in state and sub-state areas. These and other analysts use the data on an expenditure basis for studies that evaluate Federal revenues from state areas versus Federal expenditure to those areas.

Due to the termination of the Federal Financial Statistics program, the Consolidated Federal Funds Report data will no longer be available.

### Z Score

- < -2.5 Std. Dev.
- 2.5 - -1.5 Std. Dev.
- 1.5 - -0.50 Std. Dev.
- 0.50 - 0.50 Std. Dev.
- 0.50 - 1.5 Std. Dev.
- 1.5 - 2.5 Std. Dev.
- > 2.5 Std. Dev.

This Z score in the table is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, federal expenditure decreases are less desirable than increases. The Z score map (left) shows original Z scores

# Income Per Capita and Income Change\*

Greene County experienced the largest increase in income per capita (35%) amongst all PA Counties from 2002-2011. Washington County had the second-highest increase (25%).

Per capita income is often used as average income. Here it is used as a measure of the wealth of the population of a county, and can be used in comparison to other counties. Per capita income is often used to measure a country's standard of living.

It is calculated by taking a measure of all sources of income in the aggregate (such as Gross national income) and dividing it by the total population.

\* All dollar estimates are in current dollars, therefore they have not been adjusted for inflation.

# Median Household Income

Greene County experienced the 10<sup>th</sup> largest increase in household income (4.9%) amongst all PA Counties from 2009-2011. Washington County had the 11<sup>th</sup> highest increase (4.1%).

Median income is the amount which divides the income distribution into two equal groups, half having income above that amount, and half having income below that amount.

Mean income (average) is the amount obtained by dividing the total aggregate income of a group by the number of units in that group. The means and medians for households and families are based on all households and families. Means and medians for people are based on people 15 years old and over with income.

Household income is not to be confused with family or personal income. Household income is often the combination of two income earners pooling the resources and should therefore not be confused with an individual's earnings.

Chester County	72.2%	17.1%	10.8%	-2.60	67

Greene County ranks 26<sup>th</sup> of 67 for amount of income from transfer payments (27%). The PA average percent of income from transfer payments is 25%. The PA average for income from dividends, interest and rent is 15%. Both Greene and Washington Counties fall below this average.

The Sources of Income indicators show how income is earned based on three categories: Income earned by 1) wages or salary, 2) dividends, interest, or rent, and 3) transfer payments. Wages and salary compose income from service rendered with labor. Dividends, interest, or rents compose income from various forms of investments. Transfer payments are all forms of government transfers of payments to individuals (i.e., public assistance, welfare, social security) but not related to income from services rendered or retirement payments.

Greene County (11.2%) is the second lowest (by less than 1%) for the county with the *least* amount of income earned by dividends, interest or rent. Only Philadelphia County is lower at 10.6% This makes Green the lowest ranked rural county that generates income from sources other than wages/salary or transfer payments.

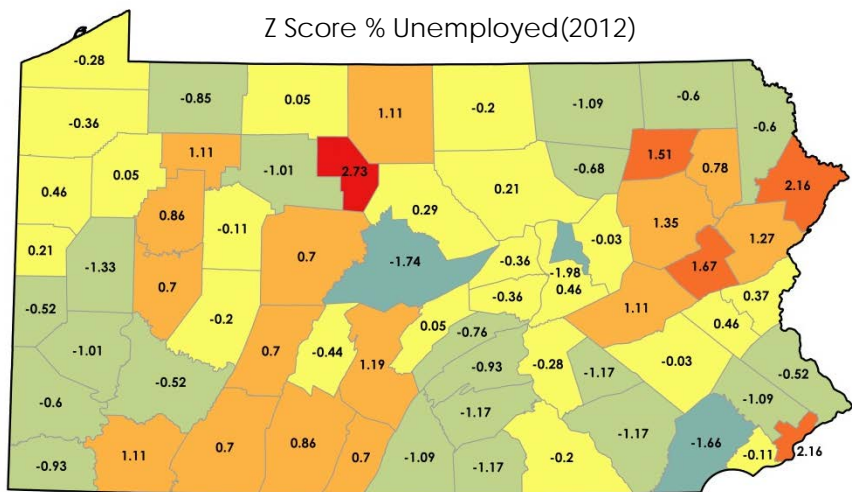

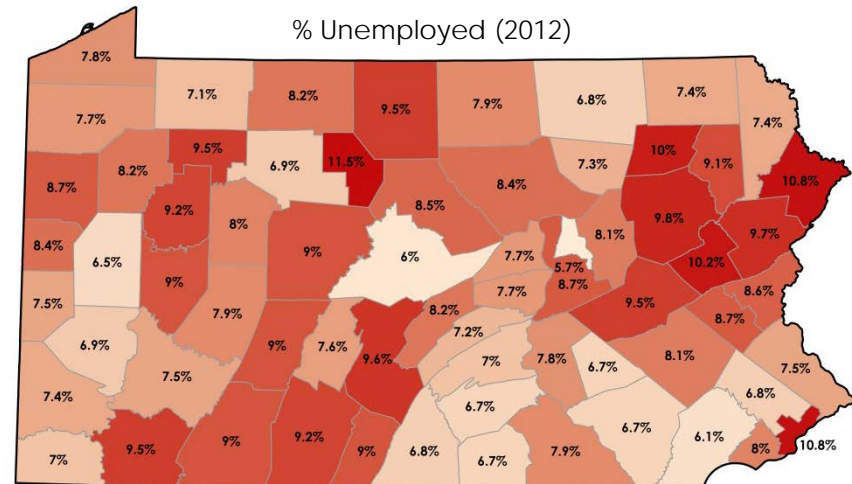

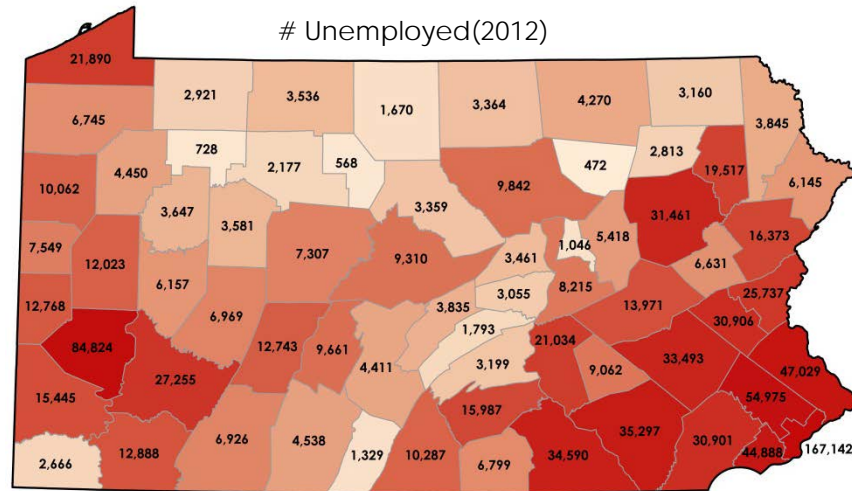

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Data beyond two standard deviations away from the mean is considered unusual data.

# Seasonally Adjusted Unemployment Rate

Greene (7%) and Washington (7.4%) Counties experienced lower unemployment rates in 2012 than the average PA Counties (8.1%)

The unemployment rate corrects for the normal increase in the number of people employed due to increases in population and increases in the labor force relative to population. The rate is calculated by dividing the number of unemployed workers by the total labor force and multiplying by 100 (for a percentage).

Seasonal adjustment is a statistical method for removing the seasonal component of a time series that is used when analyzing non-seasonal trends. Seasonally adjusted unemployment rates are shown as a percentage of the labor force, and all data refer to place of residence.

# Poverty Rate

Greene County's poverty rate (15.5%) was 2% higher than PA's average rate (13.5%) in 2011. Washington County's poverty rate in 2011 was 10.6%.

The US Census Bureau calculates poverty thresholds each year to determine who is in poverty. Poverty thresholds are the dollar amounts used to determine poverty status. Each person or family is assigned one out of 48 possible poverty thresholds. Thresholds vary according to: size of the family, and ages of the members. The same thresholds are used throughout the United States and do not vary geographically.

The Poverty Threshold for 2011 calculated by the US Census Bureau reports that a family of four earning \$23,021 or less are below the poverty threshold. For one person, the threshold was \$11,702 if under 65 years of age, and \$10,788 if 65 or over. If total family income is less than the threshold appropriate for that family, the family is in poverty, and all family members have the same poverty status.

Nationally, the official poverty rate was 15% in 2011. There were 46.2 million people in poverty.

# Public School Revenues & Per Student Spending

Washington County's per student spending in 2010-2011 was \$12,901. In Greene County, per student spending was \$15,955. The PA average was \$13,813.

Pennsylvania public schools (school districts, career and technology centers, charter schools, and special program jointures) are required to file an annual financial report (AFR) with the Department of Education following each school year.

The data shown here is for public schools only. Included in the totals are revenues and spending per student for intermediate units and vocational technical schools.

The data shows percentages of school revenue by local, state, and federal sources for the year 2010-2011. Dividing the total school revenue by the total by the school's enrollment determines the per student spending.

- Z Score**
- < -0.50 Std. Dev.
  - 0.50 - 0.50 Std. Dev.
  - 0.50 - 1.5 Std. Dev.
  - > 1.5 Std. Dev.

This Z score is multiplied by -1 because the category Z score summary scores require positive values to indicate less-desirable conditions. In this instance, fewer dollars spent per student is less desirable than more dollars spent per student. The Z score map (left) shows original Z scores.

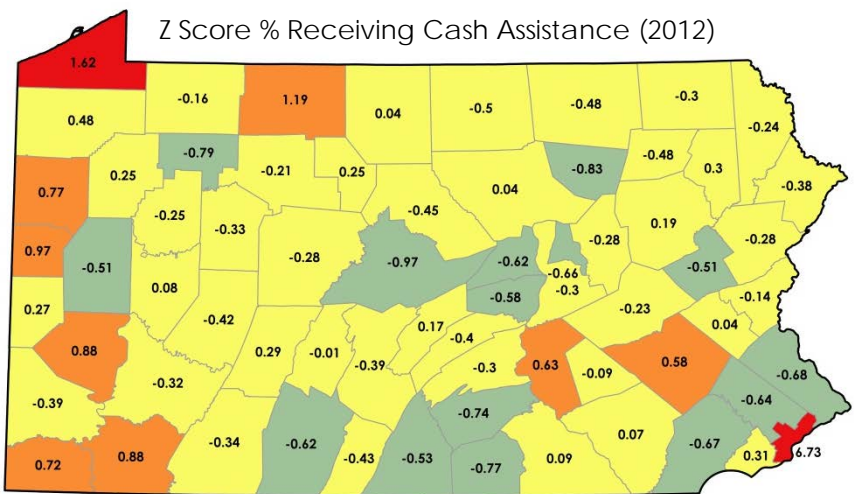

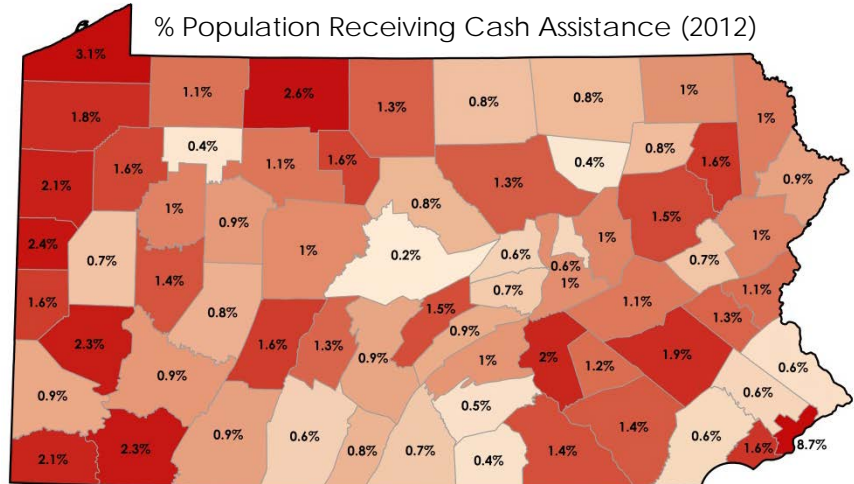

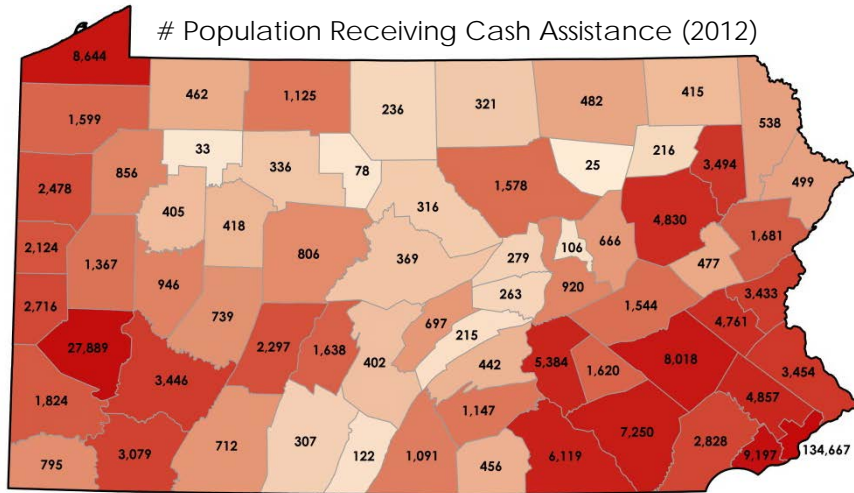

$$Z = \frac{(\text{County Value}) - (\text{Average of All Counties})}{(\text{Standard Deviation of All Counties})}$$

Data beyond two standard deviations away from the mean is considered unusual data.

# Public Assistance - Cash Assistance

In 2012, 2.1% of Greene County's population received some form of cash assistance from PA. Only 0.9% of Washington County's population received cash assistance. The PA average, by county, was 1.3%.

Pennsylvania citizens may be eligible for cash assistance if there is not enough income generated to support an individual or a family, or if an individual cannot work because of a disability.

Cash Assistance programs include; the Temporary Assistance for Needy Families (TANF), the Diversion Program, the State Blind Pension Program, and the Refugee Cash Assistance Program.

TANF provides money for pregnant women, dependent children and parents or relatives who live with them. The Diversion Program is a one-time lump sum for eligible emergencies. The State Blind Pension Program provided blind pensions benefits for adults who meet visual requirements and other conditions. The Refugee Cash Assistance Program provides money for up to eight months from the date of entry into the United States for refugees who do not meet TANF)eligibility.

# Public Assistance - Eligible for Medical Assistance

Greene County's poverty rate (15.5%) was 2% higher than PA's average rate (13.5%) in 2011. Washington County's poverty rate in 2011 was 10.6%.

Medicaid, also called Medical Assistance (MA), offers free health care coverage to children and adults. Eligibility is based on family size and income, and the age of your children.

Benefits may include check ups, hospital stays, shots, prescriptions, and dental and vision coverage. Under Medicaid, all medically necessary services for children are covered.

An MA identification card called the "Pennsylvania ACCESS card" is issued to each eligible individual.

# Public Assistance - National School Lunch Program (NSLP)

The school-aged population of Greene County that was eligible for free or reduced school lunches was 45%. Washington County had 31% eligible in the same year. The PA average, by county, was 40%.

The National School Lunch Program (NSLP) is a federal and state reimbursement program for each meal served that meets federal requirements. All NSLP sponsors are required to offer free and reduced-price lunches to eligible children. Reimbursement rates are established annually by the United States Department of Agriculture (USDA).

Any public school, intermediate unit, charter school, area vocational technical or career technology school, public residential child care institution, and tax exempt non-public school or residential child care institution may apply to be an NSLP sponsor.

Children from families with incomes at or below 130% of the poverty level, and children in families receiving Temporary Assistance for Needy Families (TANF) and children in families receiving food stamp benefits are eligible for free lunches. Children in families whose income is between 130% and 185% of the poverty level are eligible for reduced price lunches.

# Public Assistance

## SNAP (Food Stamps) Supplemental Nutrition Assistance Program (SNAP)

The percentage of Greene County's population receiving SNAP benefits in 2012 was 18%, and Washington County was 11.4%. The PA average per county was 13.2%.

The Supplemental Nutrition Assistance Program is the new name for the Food Stamp program. These benefits are used to buy food and help eligible low-income households in Pennsylvania obtain more nutritious diets by increasing their food purchasing power at grocery stores and supermarkets. Eligible residents receive a Pennsylvania Electronic Benefits Transfer (EBT) ACCESS Card which is used to make food purchases at grocery stores and supermarkets.

The maximum monthly benefit amount for one person is \$200. The maximum monthly benefit amount for a family of four is \$668.

To get SNAP benefits, applicant income has to be under certain limits. SNAP households may receive deductions from their gross income for things like housing costs, child or dependent care payments, and medical expenses over \$35 for elderly or disabled people.

Mean

# Public Assistance - WIC (Women, Infants and Children)

The percentage of Greene County's population receiving WIC benefits in 2010 was 2.5%, and Washington County was 1.6%. The PA average per county was 2.1%.

WIC is a federally funded program that provides healthy supplemental foods and nutrition services for pregnant women, postpartum and breastfeeding women, infants and children under age five in a supportive environment.

The goal of the WIC Program is to decrease the risk of poor birth outcomes and to improve the health of the participants during critical stages of growth and development.

The Pennsylvania WIC Program states that it is committed to improving the health of eligible pregnant women, new mothers, and children by providing nutrition education, breastfeeding support, healthy foods, and referrals to health and social programs during the critical stages of fetal and early childhood development.

# Public Assistance - Population Participating in PACE Pharmaceutical Assist. Contract for the Elderly (PACE)

The percent of eligible-aged population enrolled in PACE in 2011 in Greene County was 17.3% and in Washington was 17.2%. The PA average, by county, was 19.3%.

PACE, PACENET and PACE plus Medicare are Pennsylvania's prescription assistance programs for older adults, offering low-cost prescription medication to qualified residents, age 65 and older.

To be eligible for PACE, an applicant must be 65 years of age or older, a PA resident for at least 90 days, and not enrolled in the Department of Welfare's Medicaid prescription benefit.

If the above conditions are met, PACE eligibility is determined by the applicants previous calendar year's income. For a single person, total income must be \$14,500 or less. For a married couple combined total income must be \$17,700 or less.

# Highways by Type

Greene County ranked 30<sup>th</sup> of 67 in terms of highway miles per square mile with approximately 2.61 miles. Washington County's 3.33 miles was above the PA average, per county, of 3 miles.

Highway miles (and population) are used by the PA Public Utilities Commission to determine if a municipality without active drilling is eligible to receive Act 13 disbursements by calculating whether it is contiguous to a municipality with wells or within five miles of a municipality with wells.

As defined in Act 13, the calculation for highway miles is based on the number of miles of public roads and streets most recently certified by the Department of Transportation as eligible for distribution of liquid fuels funds under the Liquid Fuels Tax Municipal Allocation Law.

# Shale Gas Drilling - Active Permit Sites

Washington and Greene Counties ranked #3 (1.5) and #4 (1.41), respectively, for unconventional (shale) gas wells per square mile. The PA average in 2013 was 0.22 per sq. mi.

According to the PA Department of Environmental Protection, twenty-seven of the sixty-seven counties in Pennsylvania have been issued at least one 'unconventional' gas well drilling permit.

An unconventional gas well is a bore hole drilled or being drilled for the purpose of producing natural gas from an unconventional formation.

Unconventional formation is a geological shale formation existing below the base of the Elk Sandstone or its geologic equivalent stratigraphic interval where natural gas generally cannot be produced at economic flow rates or in economic volumes except by vertical or horizontal well bores stimulated by hydraulic fracture treatments or by using multilateral well bores or other techniques to expose more of the formation to the well bore.

This is commonly known as a 'shale' gas well.

# Shale Gas Drilling - Water Withdrawals

Greene and Washington Counties ranked #2 and #3 for the most water withdrawals for shale gas development per 100 square miles..

Water withdrawals include ground water, surface water, and municipal (interconnection) withdrawals.

Ground water withdrawals include subfacilities that may be a well, spring, quarry, infiltration gallery, deep mine, surface mine or an unidentified facility type. Surface water withdrawals include subfacilities that may be an instream diversion, intake from a dam, natural lake, pond, river well, or an unidentified facility type. An Interconnection subfacility type represents the point of interconnection between a water resources primary facilities. The subfacility type may be for an interconnection between two public water supply agencies or between a public water supply agency and a commercial or industrial water user.

For a further breakdown of these withdrawal type, see 'Water Resrouces\_2013\_04' spatial data by the PA DEP.

# Shale Gas Drilling - Water Discharges

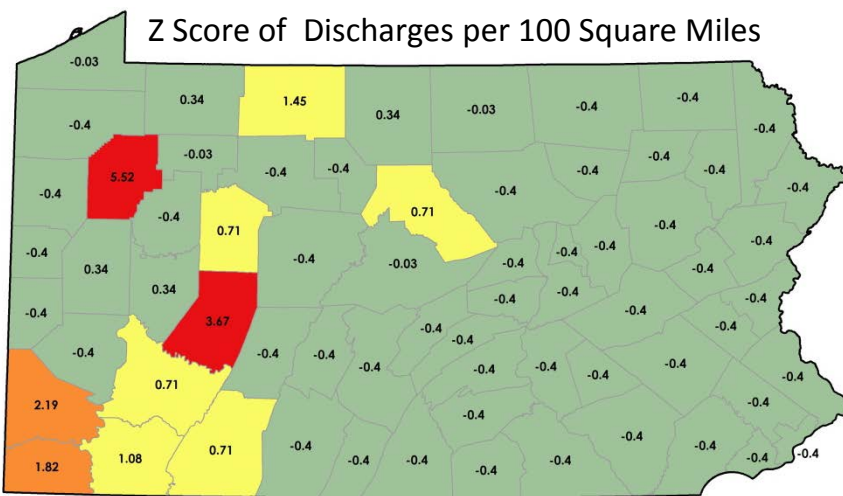

Greene and Washington Counties ranked #3 (1.04) and #4 (0.81), respectively, for the most oil and gas related water discharges per 100 square miles among the sixty-seven counties in PA.

Oil and Gas Pollution Control facilities 2013\_04. Data shows those facilities that are either active or proposed. Facility types include discharge points and treatment plants. Monitoring points are not included in these numbers.

A Discharge Point is the outfall from a wastewater treatment facility for oil and gas fluids. A Treatment Plant is a facility for treating oil and gas wastewater to achieve permit effluent limits.

# Coal Mining - Underground Acres (Active, Pending, and Known Legacy)

Greene and Washington Counties ranked #1 (65.5%) and #2 (56.9%), respectively, for percent of county undermined or permitted by underground coal operations. The PA average in 2013 was 4.4% underground coal mined.

According to the PA Department of Environmental Protection, twenty of the sixty-seven counties in Pennsylvania are known to have experienced underground coal mining (UGCM) that has been documented.

Five counties have experienced longwall coal mining at some point in time. (Armstrong, Cambria, Greene, Indiana, and Washington). Currently, only Greene and Washington Counties have active and/or pending longwall coalmining permits.

The longwall mines in Green and Washington mine the Pittsburgh Coal Seam, which has a seam height from 62" to 84" and between 500' to 1,200' below the surface (Coal Age, Feb. 2013).

# Coal Mining - Surface Mines, Processing & Preparation Sites

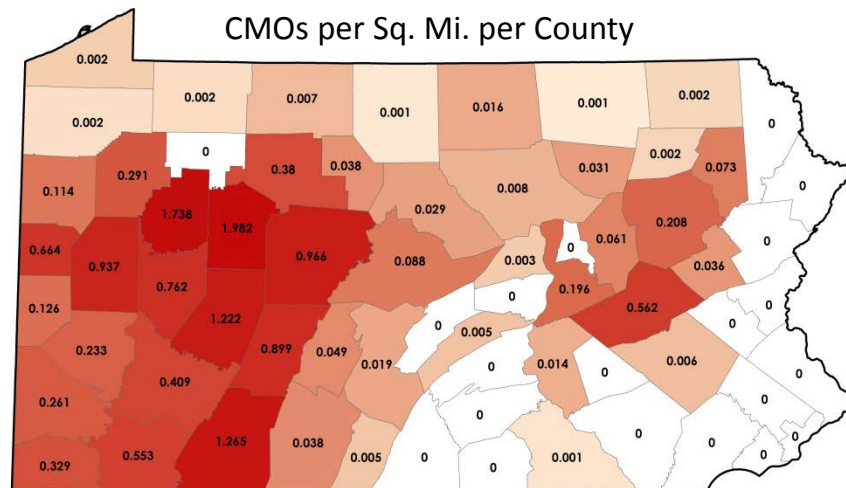

Greene and Washington Counties ranked #14 (0.33) and #16 (0.26), respectively, for the number of surface coal mining operations (CMOs) per square mile. The PA average in 2013 was 0.22 CMOs per square mile per county.

This data shows coal mining operations (CMOs) as points are cataloged by the PA DEP. The density of points per acre per county is used as an indicator.

CMOs in this data include:

- discharge points
- coal storage and preparation facilities
- NPDES discharge points
- post-mining discharges (groundwater seeps and flows)
- refuse disposal facilities
- mining stormwater sites
- refuse reprocessing facilities, and
- surface mines

Untreated discharges that enter clean streams cause acidification, which immediately kills much of the aquatic life. Coal mines that are predicted to have discharges are not permitted; however, coal mining operators are required to treat post-mining discharges in cases where the predictions do not come true.

# Coal Mining - Abandoned Mine Land Sites (AMLs)

Washington County ranks 17<sup>th</sup> of 67 with 5.3% of its area composed of abandoned mine land (AML) problem areas. Greene County is 27<sup>th</sup> with 1.3% of its area AMLs. The PA average, by county, is 2.9%.

According to the Pennsylvania Department of Environmental Protection and the United States Office of Surface Mining, forty-three of the sixty-seven counties in Pennsylvania are known to have some type of abandoned mine land that has been documented.

The data set used to determine the values was the 'AML Problem Areas'. This data set encircles discrete AML points and areas and defines 'Problem Areas' as areas containing public health, safety, and public welfare problems created by past coal mining.

The Problem Area acreage represents the polygons around many AMLs and therefore represents more area than the individual AML sites.

This data is needed to implement Title IV SMCRA activities and is used for the reporting of the annual Abandoned Mine Land Program accomplishments to the US Congress.

Mean

# Category Z Score Summary Maps

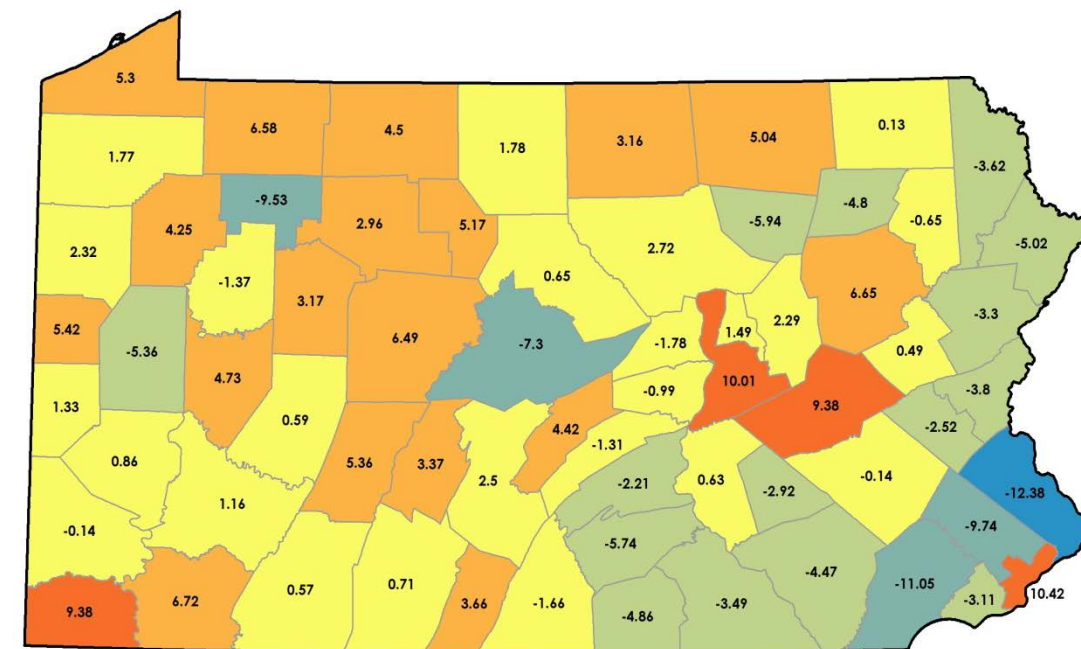

These Category Z Score Summary Maps show the County Summary Z Scores Values from the table on Page 49 and colors each by the sum's standard deviation from the mean.

## Demographic Category Z Score Summary

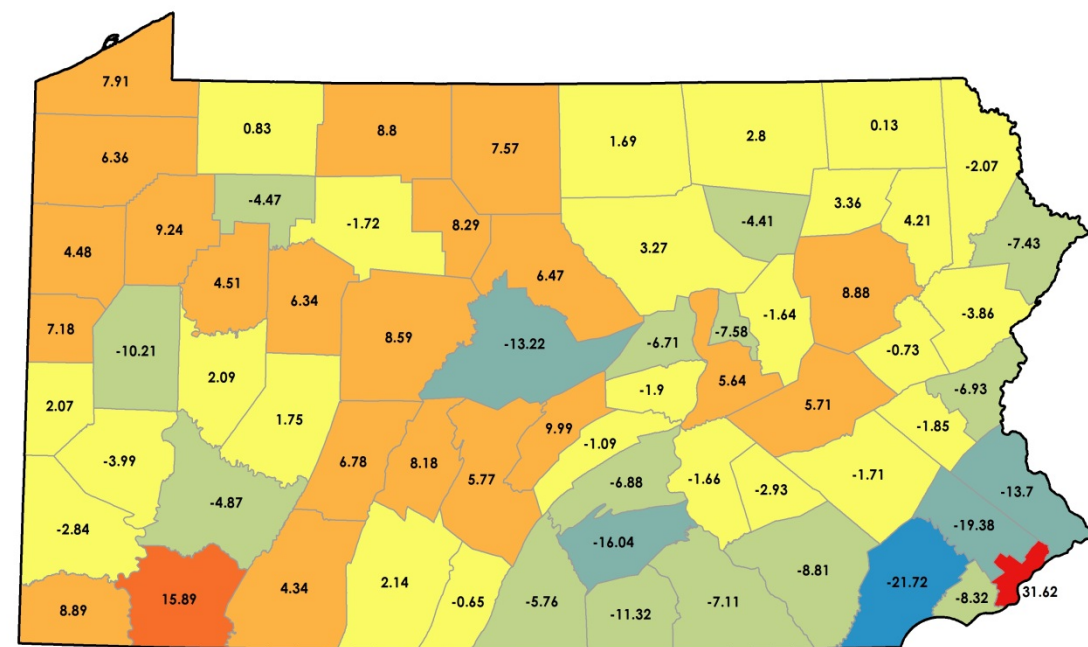

The higher the positive Z score, the less desirable.

## Social Category Z Score Summary

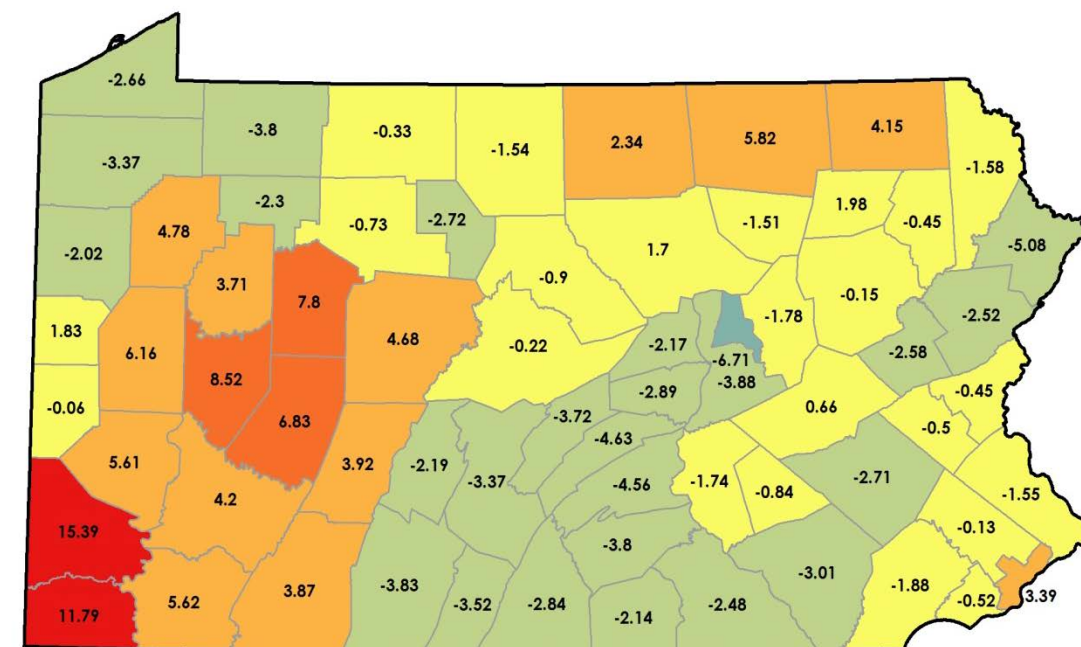

The higher the positive Z score, the less desirable.

## Economic Category Z Score Summary

The higher the positive Z score, the less desirable.

## Landscape Category Z Score Summary

The higher the positive Z score, the less desirable.

# Glossary

**Birth Rate** – the total number of births per 1,000 of a population each year.

**Child Abuse** – abuse in the United States is defined as the maltreatment as in any act or series of acts of commission or omission by a parent or other caregiver that results in harm, potential for harm, or threat of harm to a child.

**Coal Mining – Underground** – a practice of removing coal from beneath the ground by tunneling or boring beneath the ground in effort to expose the coal seam for harvesting.

**Coal Mining - Surface** – a practice of removing coal from beneath the ground by removing the earth-material between the surface and the coal-seam in effort to expose the coal seam for harvesting.

**Coal Mining – Abandoned Mine Lands** – mine lands that have been abandoned prior to the passage of the Surface Mining Control and Reclamation Act of 1977.

**Crime Rate** – crime rate is the amount of defined and reported crimes experienced in a geographic area by a unit of population.

**Dependent Population** – those individuals in a population that are either under the ages of 18 or over the age of 65. These are generally the ages of populations out of the work-force.

**Employment by Sector** – industrial production is categorized into major industrial sectors. Employment by Sector shows how many in a population are employed by the various industrial sectors.

**Farmland Loss** – the amount of land defined by the USDA as ‘farm land’ that has ceased to be ‘farm land’ during a period of time.

**Federal Expenditures** – the US Government’s spending of funds.

**Highways by Type** – a sum of different roadways by types (local, state, federal).

**Homeownership** – a owner-occupier of a dwelling. Usually expressed as a percentage of people who own a home in a particular geographic unit.

**Housing Age** – the average age of the housing stock in a particular geographic unit.

**Housing Type** – descriptive characteristic describing the various types of housing structures in a particular geographic unit.

**Housing Value** – the average value of a home in a particular geographic unit.

**Income Per Capita** – calculated by taking a measure of all sources of income in the aggregate (such as Gross national income) and dividing it by the total population of a particular geographic unit.

**Land Area** – the amount of land of a particular geographic unit, usually expressed in square miles.

**Mean** – average; the sum of a collection of numbers divided by the number of numbers in the collection

**Median Household Income** – the amount which divides the income distribution into two equal groups, half having income above that amount, and half having income below that amount.

**Mortality** – a measure of the number of deaths (in general, or due to a specific cause) in a population, scaled to the size of that population, per unit of time.

**Population Density** – a measurement of population per unit area or unit volume.

**Population Growth** – increase (or decrease) of people living in a specific area.

**Poverty Rate** – the percent of people who were in poverty in a calendar year.

**Poverty Rate for Children** – the percent of people under 18 years of age who were in poverty in a calendar year.

**Per Student Spending** – calculated by dividing the total school revenue by the total by the school’s enrollment.

**Public Assistance – Cash Assistance** – a state program that may provide cash assistance if there is not enough income generated to support an individual or a family, or if an individual cannot work because of a disability.

**Public Assistance – Medical Assistance** – also called Medicaid, offers free health care coverage to children and adults. Eligibility is based on family size and income, and the age of your children.

**Public Assistance – NSLP** – the National School Lunch Program is a federal and state reimbursement program for each meal served that meets federal requirements. Children from families with incomes at or below 130% of the poverty level, and children in families receiving Temporary Assistance for Needy Families (TANF) and children in families receiving food stamp benefits are eligible for free lunches.

**Public Assistance – SNAP** – the Supplemental Nutrition Assistance Program is the new name for the Food Stamp program. Eligibility is based on income.

**Public Assistance – WIC** – Women, Infants and Children is a federally funded program that provides healthy supplemental foods and nutrition services for pregnant women, postpartum and breastfeeding women, infants and children under age five in a supportive environment.

**Public Assistance – PACE** – Pharmaceutical Assistance Contract for the Elderly is a PA prescription assistance program for older adults that offers low-cost prescription medication to eligible residents 65 and older.

**Public School Drop Out Rate** – a calculation that reflects the fall enrollment in grades 7 through 12 and the total number of dropouts in those grades through a single school year.

**Racial Diversity** – the racial composition of a population.

**Rate of Natural Increase (RNI)** – determined by taking the crude birth rate minus the crude death rate of a population.

**Serious Crimes** – crime Index offenses under the Uniform Crime Report and include; criminal homicide, forcible rape, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft, and arson.

**Shale Gas Drilling – Permits** – the amount of PA DEP approved permit applications for unconventional gas wells in a particular geographic unit.

**Shale Gas Drilling – Water Withdraw** – the amount of PA DEP approved permit applications for the removal of ground water, surface water or municipal water sources for the use in unconventional gas wells in a particular geographic unit.

**Shale Gas Drilling – Water Discharge** – the amount of PA DEP active or proposed permit applications for treatment plants or discharge points of wastewater that was once used in unconventional gas wells in a particular geographic unit..

**Standard Deviation** – shows how much variation exists from the mean.

**Transfer Payments** – all forms of government transfers of payments to individuals (i.e., public assistance, welfare, social security) but not related to income from services rendered or retirement payments.

**Unemployment** – calculated by dividing the number of unemployed workers by the total labor force and multiplying by 100 (for a percentage).

**Vacant Housing** – the amount of housing stock in a particular geographic area that is not being utilized as a dwelling.

**Voter Participation** – the percentage of registered voters that participate in an election.

**Z Score** – the number standard deviations an observation is above or below the mean.

# The Principles of Environmental Justice

Delegates to the First National People of Color Environmental Leadership Summit held on October 24-27, 1991, in Washington DC, drafted and adopted 17 principles of Environmental Justice. Since then, *The Principles* have served as a defining document for the growing grassroots movement for Environmental Justice.

## PREAMBLE

**WE, THE PEOPLE OF COLOR**, gathered together at this multinational People of Color Environmental Leadership Summit, to begin to build a national and international movement of all peoples of color to fight the destruction and taking of our lands and communities, do hereby re-establish our spiritual interdependence to the sacredness of our Mother Earth; to respect and celebrate each of our cultures, languages and beliefs about the natural world and our roles in healing ourselves; to ensure environmental justice; to promote economic alternatives which would contribute to the development of environmentally safe livelihoods; and, to secure our political, economic and cultural liberation that has been denied for over 500 years of colonization and oppression, resulting in the poisoning of our communities and land and the genocide of our peoples, do affirm and adopt these Principles of Environmental Justice:

- 1) **Environmental Justice** affirms the sacredness of Mother Earth, ecological unity and the interdependence of all species, and the right to be free from ecological destruction.
- 2) **Environmental Justice** demands that public policy be based on mutual respect and justice for all peoples, free from any form of discrimination or bias.
- 3) **Environmental Justice** mandates the right to ethical, balanced and responsible uses of land and renewable resources in the interest of a sustainable planet for humans and other living things.
- 4) **Environmental Justice** calls for universal protection from nuclear testing, extraction, production and disposal of toxic/hazardous wastes and poisons and nuclear testing that threaten the fundamental right to clean air, land, water, and food.
- 5) **Environmental Justice** affirms the fundamental right to political, economic, cultural and environmental self-determination of all peoples.
- 6) **Environmental Justice** demands the cessation of the production of all toxins, hazardous wastes, and radioactive materials, and that all past and current producers be held strictly accountable to the people for detoxification and the containment at the point of production.
- 7) **Environmental Justice** demands the right to participate as equal partners at every level of decision-making, including needs assessment, planning, implementation, enforcement and evaluation.

8) **Environmental Justice** affirms the right of all workers to a safe and healthy work environment without being forced to choose between an unsafe livelihood and unemployment. It also affirms the right of those who work at home to be free from environmental hazards.

9) **Environmental Justice** protects the right of victims of environmental injustice to receive full compensation and reparations for damages as well as quality health care.

10) **Environmental Justice** considers governmental acts of environmental injustice a violation of international law, the Universal Declaration On Human Rights, and the United Nations Convention on Genocide.

11) **Environmental Justice** must recognize a special legal and natural relationship of Native Peoples to the U.S. government through treaties, agreements, compacts, and covenants affirming sovereignty and self-determination.

12) **Environmental Justice** affirms the need for urban and rural ecological policies to clean up and rebuild our cities and rural areas in balance with nature, honoring the cultural integrity of all our communities, and provided fair access for all to the full range of resources.

13) **Environmental Justice** calls for the strict enforcement of principles of informed consent, and a halt to the testing of experimental reproductive and medical procedures and vaccinations on people of color.

14) **Environmental Justice** opposes the destructive operations of multi-national corporations.

15) **Environmental Justice** opposes military occupation, repression and exploitation of lands, peoples and cultures, and other life forms.

16) **Environmental Justice** calls for the education of present and future generations which emphasizes social and environmental issues, based on our experience and an appreciation of our diverse cultural perspectives.

17) **Environmental Justice** requires that we, as individuals, make personal and consumer choices to consume as little of Mother Earth's resources and to produce as little waste as possible; and make the conscious decision to challenge and reprioritize our lifestyles to ensure the health of the natural world for present and future generations.

The Proceedings to the First National People of Color Environmental Leadership Summit are available from the **United Church of Christ Commission for Racial Justice**, 475 Riverside Dr. Suite 1950, New York, NY 10115.
