This *Activity Guide* was published by Green Schoolyards America in honor of California’s Living Schoolyard Month and the global celebration of International School Grounds Month, both held in May. Each year we update its content and add new activity ideas. A digital copy is available free of charge on our website at: [www.greenschoolyards.org](http://www.greenschoolyards.org)

**Title:** Living Schoolyard Activity Guide: United States Edition (2017)  
**Publisher:** Green Schoolyards America  
**Editor:** Sharon Danks

Green Schoolyards America greatly appreciates the collaboration of 99 author-organizations from across the United States and we extend our sincere and heartfelt thanks! Please see page 150 for a directory of contributing organizations and a map of their locations.

Overall publication © 2015-2017 Green Schoolyards America. Individual activities are copyrighted by their authors/organizations. Photographs and diagrams are copyrighted as noted in the text. Excerpts and images from this publication may not be repurposed and used in other contexts, except by the original authors/photographers and Green Schoolyards America. Any other reuse of this content requires written permission from Green Schoolyards America and the individual authors/photographers.

Introductory articles and chapter heading text © 2010-2017 Sharon Gamson Danks, written for this publication and/or adapted from materials previously published by this author. Citations are included in the *Activity Guide*’s text using the reference numbers below:

Green Schoolyards America is fiscally sponsored by Architects/Designers/Planners for Social Responsibility, a 501(c)(3) corporation.

GREEN SCHOOLYARDS AMERICA is a national organization that expands and strengthens the green schoolyard movement and empowers Americans to become stewards of their school and neighborhood environments. We believe that school grounds are uniquely positioned to enrich the daily lives of children and their communities, occupying both the geographic and social heart of almost every city across the USA and around the world. We provide resources, training and support for pre-K-12 school districts and partner with nonprofits, businesses, government agencies and utilities to effect change across the country.

We invite like-minded professionals and organizations to collaborate with us to nurture and grow the international movement to green school grounds for all children. To sign up for our mailing list, please visit our website:

[www.greenschoolyards.org](http://www.greenschoolyards.org)
WHAT ARE LIVING SCHOOL GROUNDS?

“Living school grounds are richly layered outdoor environments that strengthen local ecological systems while providing place-based, hands-on learning resources for children and youth of all ages. They are child-centered places that foster empathy, exploration, adventure and a wide range of play and social opportunities, while enhancing health and well-being and engaging the community.”

— Sharon Danks, CEO, Green Schoolyards America
May is the annual, global celebration of International School Grounds Month, coordinated by our colleagues at the International School Grounds Alliance, and it is also Living Schoolyard Month in California. We hope our Living Schoolyard Activity Guide will encourage schools across the United States, and around the world, to take their students outside during the month of May—and throughout the year—to celebrate their grounds and use them to their fullest.

This Activity Guide was developed by Green Schoolyards America with written and photographic contributions from our colleagues from 99 other organizations across the United States, including: school districts, state and national government agencies, nonprofit organizations, museums, universities, businesses and utilities. Please see page 150 for a directory of contributing authors.

Our partner organizations contributed a wide range of interdisciplinary ideas that support learning across the curriculum, promote healthy lifestyles, and encourage play and exploration during children’s free time, before, during and after school. Many of the activities also focus on ways to help children and youth build “place-based understanding,” and connect to their neighborhood’s unique natural, geographic and cultural context. We hope these ideas will inspire you and help you get started dreaming up outdoor activities for your own local school, wherever you live.

Each page in the Activity Guide notes the approximate age range that is suggested for the activity as it is written, but we hope that educators will also adapt the ideas for wider use. This publication was designed with preschool through high school aged students in mind, so we have designated suggested age ranges for each activity, from 3 to 18+ years old. Some activities may also be useful for younger and older individuals.

Please visit our website each year to download the most recent version of this Activity Guide, which is updated annually. We hope you will also enjoy the companion publication in this set, called the International School Grounds Month Activity Guide. It includes ideas in the same format, gathered from our colleagues around the world. Together the two publications in this set include a total of 187 activities for children and youth, written by 143 organizations from 21 countries. More information about the set can be found on page 157.
Celebrate in May—and Year Round!

We hope you will be inspired by the ideas in this Activity Guide, and will use your school grounds to their fullest in May, and throughout the year.

After you have participated in International School Grounds Month and Living Schoolyard Month in May, please share your adventures with us by taking the time to register on our website to tell us what you did! We are very interested in hearing from you. Your participation and reporting of your activities will help us spread the word to other schools, governments and organizations who might be able to help promote and support green schoolyards around the world in the future.

SHARE YOUR CELEBRATION

Please tell us about your schoolyard adventures in May by sending us the following information:

• Name of your school
• School location: city, state, country
• A brief description of how you celebrated Living Schoolyard Month (100-400 words)
• Photo(s) showing your activity in progress. (Please confirm you have permission to use these images and to share them with the public in print and online.)
• Contact name and email address
• Age range and number of participating students
• School or project website (if you have one)

Email this to: info@greenschoolyards.org

Following the event, we will share many of the activity reports we receive by posting them on our website and social networks. We are looking forward to hearing about your work and hope you enjoy the celebration!

Living Schoolyard Activity Guide ii
About this book

Celebrate in May—and Year Round! iv
How to participate in Living Schoolyard Month and International School Grounds Month

INTRODUCTION

Introduction 1
Why are living school grounds important? An introduction to the green schoolyard field

The Power and Potential of Green Schoolyards 5
What can we accomplish for our children and communities if every school has a living school ground?

Living Schoolyards for California 9
An overview of Living Schoolyard Month

ART

Make a Create-with-Nature Zone 13
Provide natural materials for child-driven art play and sculpture — Zach Pine Nature Sculpture and University of California, Blake Garden, Kensington, California

Nature’s Watercolors 15
Use natural pigments to create paintings — Ayesha Ercelawn, La Scuola, San Francisco, California

Mandala Suncatchers 16
Make patterns with natural materials — Chicago Botanic Garden, Glencoe, Illinois

Creative Painting with “Garden Paintbrushes” 17
Use natural materials as paint brushes — Explore Ecology, Santa Barbara, California

Using iPads to Tell Student-Created Stories 18
Take outdoor photos and use them to create a story — Oak Learning Center at the Bay Beach Wildlife Sanctuary, Green Bay, Wisconsin

Painting the Seasons 19
Use art to follow seasonal changes — Green Schoolyards America, Berkeley, California

Place-based Art Inspired by Andy Goldsworthy 20
Artfully arrange natural materials and write a story about it — Susan Hobart, Lake View Elementary School, Madison, Wisconsin

Bubble Poetry 21
Blow bubbles and write poetry — Sarah Amador, Evergreen Elementary School, Rohnert Park, California

Poetry in the Garden 22
Use garden observations to inspire poetry — Openlands, Chicago, Illinois

Object Match Challenge 23
Study and draw plants in detail — California Native Plant Society, Sacramento, California
Frozen Schoolyard Art Gallery
Create an ephemeral exhibit using ice — Green Schoolyards America, Berkeley, California

Winterberry Wreath
Create wreaths using natural materials — KidsGardening, Burlington, Vermont

Birdhouse Building
Build a birdhouse for local species — Waldorf School of the Peninsula, Los Altos, California

RECREATION

Colored Water Exploration with Ramps
Use creative play to learn about color blending — Mills College Children's School, Oakland, California

Modular Obstacle Course
Provide large natural materials for self-directed building — Golestan Colab, Berkeley, California

Schoolyard Nature Loteria
Create a board game with hand-drawn, nature-inspired cards — Latino Outdoors, Capitola, California

Birds and Worms: Camouflage Relay
Use a relay race to demonstrate camouflage — Michigan Project Learning Tree, Traverse City, Michigan

Jump the River
Practice jumping and coordination — Playworks, Oakland, California

“Everybody’s It” Tag
Tag as many players as possible — Playworks, Oakland, California

Food Web Tag
Demonstrate ecosystem interconnectivity with a game — The Greening of Detroit, Detroit, Michigan

Sierra Nevada Animal Olympics
Compete with Yosemite’s animals — Yosemite National Park Education Office, Yosemite, California

California Desert Animal Olympics
Compete with Mojave Desert’s animals — Death Valley National Park, Death Valley, California

Steal the Native Plant
Compete in teams to correctly identify plants — Center for Land-Based Learning, Winters, California

You “Can” Cast
Learn to fish using cans — Project F.I.S.H., East Lansing, Michigan

Photosynthesis Tag
Demonstrate how plants create energy — Los Angeles Unified School District, Office of Outdoor and Environmental Education, Los Angeles, California

HEALTH

Your Special Path
Explore your senses during a nature walk — Nature Explore, Lincoln, Nebraska

Senses and Sorting Nature Exploration
Explore nature using your senses — Lake Erie Nature and Science Center, Bay Village, Ohio

Outdoor Sensory Activities
Build skills through physical play — Mary Michaud, Van Hise Elementary School, Madison, Wisconsin
Multisensory Garden Tour
Use your senses to understand the environment — Chino Basin Water Conservation District, Montclair, California

Herb Bundles
Create herb bundles to explore your sense of smell — San Francisco Botanical Garden, San Francisco, California

Shades of Green
Explore your vision to discern color variations — Herb Broda, Ashland University, Ashland, Ohio

Herbal Tea Bags
Discover the tastes and aromas of different herbs — Ithaca Children’s Garden, Ithaca, New York

Sound Maps
Increase awareness of your garden by creating sound maps — Life Lab, Santa Cruz, California

Jump Rope Activities
Try new jump rope patterns — American Heart Association, Los Angeles, California

Plant Part Relay Race
Learn and categorize plant anatomy — Community Alliance with Family Farmers, Davis, California

Why Eat Colorful Rainbow Food?
Discuss nutrition and eat fresh produce — Trinity Gardens, Santa Barbara, California

Outdoor Survival
Build a fire and shelter — Wisconsin Green Schools Network, Columbus, Wisconsin

SOCIAL AND EMOTIONAL WELL-BEING

Tree Wonder
Use scale and geometry to observe and draw trees — Project Central, Kansas City, Kansas

The Tree is Like Me!
Imagine what it is like to be a tree — TreePeople, Beverly Hills, California

Lighthouse
Navigate a maze with guidance from a partner — Life Lab, Santa Cruz, California

Exploring Our Relationship to Place
Use a map to explore origins — Occidental Arts and Ecology Center, Occidental, California

Team Building: The Amazing Winter Race!
Collaborate in team relay races — Wisconsin Green Schools Network, Columbus, Wisconsin

SCHOOLYARD AGRICULTURE AND FOOD

Grow Heirloom Wheat: Seed to Feed
Plant and process wheat — Trinity Gardens, Santa Barbara, California and Center for Regenerative Agriculture, Ojai, California

Seed Saving with Children
Practice seed propagation — Grow Your Lunch, LLC, San Francisco, California

Plant Root Explorations
Create root viewing planters — Hidden Villa, Los Altos Hills, California

Roots and Shoots
Observe root structures — Full Option Science System (FOSS) Lawrence Hall of Science, University of California Berkeley, Berkeley, California
More Veggies for Me... Less for the Pests!
Practice organic pest control — Kansas Association for Conservation and Environmental Education, Manhattan, Kansas

Civilizations of the Americas: Aztec Alegría Recipe
Make alegría like the Aztecs — The Edible Schoolyard, Berkeley, California

Pumpkin Math

Science Comes to Tea
Use tea to study science — Ayesha Ercelawn, La Scuola, San Francisco, California

Processing Acorns
Learn traditional techniques to prepare acorn meal — Living Classroom, Los Altos, California

Edible Bouquets
Learn about nutrition while making delicious bouquets with fresh plants — Community Groundworks and Public Health Madison Dane County, Madison, Wisconsin

How Many Honey Bees?
Demonstrate how bees make honey — Slide Ranch, Muir Beach, California

Growing Healthy Plants and Learners
Sketch plants to understand anatomy — Openlands and Phoebe A. Hearst Fine Arts Magnet School, Chicago, Illinois

Engineer a Seed Getaway
Study and test seed dispersal methods — Joan Chadde, Michigan Tech CSEO and Susan Trull, Ottawa National Forest, Houghton, Michigan

PLACE-BASED UNDERSTANDING

Have Seeds, Will Travel
Outdoor art project — Michigan Project Learning Tree, Traverse City, Michigan

Finding Your Place in the World
Visit an outdoor site regularly for field observations — The Presidio Trust, San Francisco, California

Schoolyard Investigations Using Tools
Conduct field research on school grounds — Monterey Bay Aquarium, Monterey, California

“Sense-sational” Tree Tour
Observe the environment with five senses — Canopy, Palo Alto, California

Adopt-A-Tree
Record seasonal changes — Naomi Hershiser, Prairie Crossing Charter School, Grayslake, Illinois

Act Like Leopold
Observe and sketch seasonal changes — Aldo Leopold Nature Center, Monona, Wisconsin

I Spy a... Tree! Plant! Bug!
Explore your school grounds — Sandi Snyder, Big Pool, Maryland

Six of One, Half Dozen of the Other
Observe and classify natural materials — Life Lab, Santa Cruz, California

Reflection Writing in Your Green Schoolyard
Write about the school environment — Nature’s Voices, Green Schools Initiative, Berkeley, California
Guidebook: Native Plants in the Schoolyard  
Create a field guide for your school grounds — NoVA Outside, Arlington, Virginia

Decoding Midwestern Rocks and Minerals  
Test and identify local rocks — Avon Outdoor Learning Center, Avon, Indiana

Nature Passport  
Create a booklet for students to record nature adventures — Nature Net, Madison, Wisconsin

Create a Schoolyard Site Survey Map  
Record characteristics of the schoolyard — U.S. Fish & Wildlife Service, Sacramento, California

WILDLIFE AND HABITAT

Garden-Based Learning: Interdependence  
Plant and animal adaptations — Berkeley Public School Gardening and Cooking Program, Berkeley, California

Schoolyard Habitat Survey  
Investigate and improve schoolyard ecology — CalRecycle, Sacramento, California

Documenting Biodiversity in Your Schoolyard  
Conduct citizen science investigations — California Academy of Sciences, San Francisco, California

Passive Quadrat Sampling  
Collect and analyze biodiversity data — Eisenhower High School, Goddard, Kansas

Throw and Grow  
Plant native prairie grasses — Mississippi National River and Recreation Area, St. Paul and Minneapolis, Minnesota

Mean, Median, Mode—Oh My!  
Measure trees for a math lesson — LEAF - Wisconsin’s K-12 Forestry Education Program, Stevens Point, Wisconsin

Butterfly Habitat Hunt  
Observe schoolyard ecology — National Wildlife Federation, Schoolyard Habitats®, Midpines, California

Insect Biodiversity in the Prairie  
Collect and observe insects — Naomi Hershiser, Prairie Crossing Charter School, Grayslake, Illinois

Insects: Good, Bad or Both?  
Collect and observe insects — Kansas Association for Conservation and Environmental Education, Manhattan, Kansas

Pour a Pond: Wetland Insect Exploration  
Collect and observe macroinvertebrates — Project F.I.S.H., East Lansing, Michigan

Springtime Math with Worms  
Collect and count worms with young children — Rachel A. Larimore Consulting, Midland, Michigan

What Makes a Bird a Bird?  
Explore birds’ unique characteristics — Central Valley Joint Venture, Sacramento, California

Citizen Science: Contributing Data to Project Squirrel  
Observe and record squirrel behavior — Peggy Notebaert Nature Museum, Chicago, Illinois

Blue Whale: An Animal of Unusual Size  
Compare tree height to a whale’s length — California Coastal Commission, San Francisco, California

Least Wanted: The Invasive Sea Lamprey  
Demonstrate invasive species spread — Michigan Department of Natural Resources, Lansing, Michigan
WATERSHED STEWARDSHIP

Follow the Water: Make a Stormwater Map
Map stormwater flows on campus — The Trust for Public Land, San Francisco, California

Watch the Water: Pervious or Impervious?
Demonstrate permeability using a water race — NEXT.cc, Milwaukee, Wisconsin

Follow the Drop
Introduce stormwater management — Earth Partnership, University of Wisconsin-Madison Arboretum, Madison, Wisconsin

Calculate Rainwater Runoff
Measure your school’s stormwater catchment potential — Education Outside and San Francisco Public Utilities Commission, San Francisco, California

Sheet Mulching: Turn Lawns into Native Gardens
Replace lawns with native gardens to conserve water — StopWaste, Alameda County, California

School Outdoor Water Use Audit
Assess your schoolyard’s water efficiency — Sacramento City Unified School District, Sacramento, California

Know Your Snow
Observe snow and the water cycle — Green and Healthy Schools Wisconsin, Madison, Wisconsin

Subnivian Explorations
Explore the layers of the snow-pack — Learning by Nature, Bozeman, Montana

ENERGY AND CLIMATE

Math in the Real World: Angles of the Sun
Find the angle of the sun to determine placement of solar panels — REAL School Gardens, Washington, DC

Introduction to Renewable Energy
Model renewable energy sources — Education Outside, San Francisco, California

How Cool is Your Schoolyard?
Measure microclimates on school grounds to understand localized urban heat island effects — Green Schoolyards America, Berkeley, California

Fabric Sun Prints
Use light sensitive paint to create images — Ithaca Children’s Garden, Ithaca, New York

Make a Solar Etching
Use the sun’s energy to etch designs — Rahus Institute - Solar Schoolhouse, Sebastopol, California

Diminishing Returns
Demonstrate laws of thermodynamics and energy loss — KEEP - Wisconsin K-12 Energy Education Program, Stevens Point, Wisconsin

Introduction

When you think about typical school grounds, what image first comes to mind? For many people, school grounds are places covered by paved surfaces and manicured sports fields, adorned with a few, simple shrubs and trees, and one or two ordinary climbing structures. Most school grounds look the same, with very little variation to reflect unique aspects of each school community, the neighborhood’s ecological or geographic context, or teachers’ preferred curricula.

Children are masters at reading what Wendy Titman calls the “hidden curriculum” of school grounds, and understand the value adults place on them through the level of care given to their surroundings. The messages most traditional schoolyards send children about their place in the world is not reassuring—particularly in our cities where many school sites are paved and are home to very few living things.

Outside of school, spaces children can explore on their own have been shrinking over the last few generations, reducing children’s domain from miles of free ranging territory to the limited zone between home and the end of the block. Schoolyards are now one of the only places many children are allowed to play outdoors on a daily basis, and they are increasingly important for fostering children’s health and development. With this in mind, schools have a special responsibility to provide the next generation with outdoor experiences that help them develop their curiosity, their sense of adventure, a healthy lifestyle and a love of nature.

A green or “living” school ground movement is gaining momentum around the globe and has the potential to improve the lives of every child, every day. Schools are reshaping their conventional yards, designed for 1940s educational methods, and creating beautiful, ecologically diverse landscapes with an eye toward the future. School ground greening creates rich environments that connect nature and environmental sustainability with place-based learning, hands-on curricula, and imaginative play, while also building community.

The movement is growing around the world, and we invite you to join us in this vitally important work.

WHAT ARE LIVING SCHOOL GROUNDS?

Living school grounds are richly layered outdoor environments that strengthen local ecological systems while providing place-based, hands-on learning resources for children and youth of all ages. They are child-centered places that foster empathy, exploration, adventure and a wide range of play and social opportunities, while enhancing health and well-being and engaging the community.
WHY ENRICH SCHOOL GROUNDS?

TEACH PLACE-BASED UNDERSTANDING. Living schoolyards provide opportunities for students to tune in to their surroundings and get hands-on experience with nature while gaining a better understanding of their own neighborhoods. They help children mark the seasons with changes in wildlife migrations, colorful leaves in autumn, and the length of shadows on the ground. They bring watershed education to life, as classes step outside when it rains to watch the rain flow off their school building, through a downspout, and out into the school’s rain garden or cistern. Many excellent, low-cost educational resources sit right outside the classroom doors, waiting to be tapped.

PRACTICE STEWARDSHIP. Ecologically-rich schoolyards address important environmental issues in ways that even young children can participate in and understand. Students can identify place-based environmental concerns themselves and become empowered to repair them, enriching their own corner of the world with their ingenuity. While these individual actions may be small, together these projects can fundamentally improve the local environment and profoundly change the way that students understand their place in the world. This is an inspiring and optimistic way to approach the field of environmental education.

FOSTER ADVENTURE, WONDER AND HEALTH. Green school grounds foster children’s social, physical and intellectual growth by providing settings for imagination, exploration, adventure and wonder, and serve as dynamic environments in which to run, hop, skip, jump, twirl, eat and play in active, challenging and creative ways. Enriched school grounds provide child-driven, play-based solutions to the obesity epidemic and can promote healthier lifestyles through increased physical activity and nutrition-oriented gardening and cooking programs.

ENGAGE THE COMMUNITY. Living schoolyards teach ecological literacy, invigorate children’s bodies, open and inspire young minds, and knit our communities more closely together in the process. Successful green schoolyards are the product of many hands that harness the collaborative potential of their school communities. Like the barn raisings of previous generations, cooperation among community members reinforces interdependence, local self-reliance and a sense of community creating useful, beautiful places at low cost. When parents, teachers and students work together to improve their school and grounds, they foster closer relationships that in turn support student achievement and well-being. This movement shifts the way our society views these important, shared public spaces, and supports school district land management efforts with the energy of community partners.

The transition from a conventional, paved schoolyard to a living schoolyard can be dramatic and opens up a variety of opportunities for children to learn, play and explore.
MODEL THE FUTURE YOU WOULD LIKE TO SEE

Well-designed green schoolyards model the ecologically-rich cities we would like to inhabit, at a smaller scale, and teach the next generation how to live more lightly on the Earth—shaping places where urbanization and nature coexist and natural systems are prominent and visible, for all to enjoy.

They inspire students and their communities with organic food production, wildlife habitat, energy conservation and production, rainwater collection and management, sustainable design practices and creative artwork. By teaching students to explore their environment with their hands, hearts, and minds—whether they are climbing into a tree house or tackling the challenges of the surrounding world—living schoolyards help us to plant seeds that will blossom as children grow up and help to shape an ecologically literate society.

We are all important participants of the green schoolyard movement. You can help it reach its potential to touch children in every neighborhood—by starting with your own. Get a conversation going with your neighbors, the principal at your local school, and your school district administrators. Dream of the school environment you would like to see for our children, and then help to shape this reality at your local school. The schoolyards of tomorrow will be what you and your community make them.

Environmental city planner Sharon Danks is CEO of Green Schoolyards America, based in Berkeley, California, USA. She is a co-founder of the International School Grounds Alliance and the author of the book, Asphalt to Ecosystems: Design Ideas for Schoolyard Transformation. Her work transforms school grounds into vibrant public spaces that reflect and enhance local ecology, engage the community, and nurture children as they learn and play.
The Power and Potential of Green Schoolyards

Public school districts are one of the largest landowners in almost every city and town across the United States and around the world. In the United States alone, over 98,000 schools in nearly 13,500 school districts serve more than 50 million pre-kindergarten to 12th grade students each year.

Choices made by school districts about how they manage their landscapes profoundly impact their city and generations of local residents whose perspectives are shaped through daily, outdoor experiences at school. A movement to green school grounds and connect students to nature is gaining momentum in the United States and around the globe, weaving the ideas of urban sustainability and ecological design together with academic achievement, public health, children’s wellbeing, sense of place, and community engagement.

Green schoolyards bring nature back to cities and suburbs by transforming barren asphalt and ordinary grass into vibrant environments for learning and play, set within the context of the rich, local ecosystems that nurture wildlife and the natural processes that underlie and sustain our urban infrastructure. Green schoolyards foster children’s social, physical, and intellectual growth and health by providing settings for curiosity, collaboration, imagination, exploration, adventure, and wonder.

If, as a society, we can turn our attention and resources toward creating school district-wide, ecological systems-based improvements to school grounds, we will make significant progress in addressing complex inter-related problems. Large scale schoolyard greening efforts, if implemented across our cities, have the potential to provide:

ACCESS TO NATURE

DAILY NATURE ACCESS – If green schoolyards can be built at every school, they will provide every child in every city with high quality access to nearby nature on a daily basis—democratizing nature access across socio-economic, racial and cultural lines.

BALANCE – Hands-on, daily access to nature on school grounds helps to balance real-world, sensory experiences with our increasingly digital world.

SENSE OF PLACE – Green schoolyards, built with local, natural materials and native plants, are each unique, reflecting the geography, ecology, and culture of their community and building a sense of place for children and adults who spend time in them.
ECOLOGICAL INFRASTRUCTURE REPAIR

WATER – School grounds designed to manage stormwater can be beautiful and educational while containing and conserving rainwater and purifying urban runoff.

HABITAT – Schoolyard landscapes planted with native vegetation can complement local habitat conservation plans and add many additional acres to support wildlife.

CLIMATE – Trees and shrubs can be placed to provide shade for children and school buildings, reducing sun exposure, urban heat island effects, and interior cooling costs for school buildings.

ENERGY – School grounds can host renewable energy demonstration systems that power decorative fountains—or the school—teaching children and their communities about clean energy.

MATERIALS – Landscape features designed using sustainable, natural and recycled building materials demonstrate green building practices and reduce a school district’s impact on landfills and other urban infrastructure.

IMPROVED TEACHING AND LEARNING ENVIRONMENTS

EDUCATIONAL ATTAINMENT – Studies show that many children learn better with hands-on experiences in the types of outdoor settings green schoolyards afford.

IMPROVED TEACHER SATISFACTION – Outdoor teaching environments are also appreciated by teachers who benefit from abundant teaching resources, conveniently located near their classrooms, and the variety and diversity of experiences found in outside.

REDUCED BULLYING – Green schoolyards promote imaginative play and provide variety and diversity in children’s social and play environments, reducing boredom, shifting social leadership structures, and leading to fewer disciplinary problems such as playground bullying.

HEALTH AND WELLBEING

OBESITY PREVENTION – Green schoolyard environments that provide opportunities for exploration and imagination offer child-driven, play-based solutions to the obesity epidemic.

HEALTHIER LIFESTYLES – Green schoolyards promote healthier lifestyles through increased physical activity and nutrition-oriented gardening and cooking programs. They are also settings for learning new skills that foster lifelong health, from balance to water safety and tool use.

IMPROVED WELLBEING – Green spaces of all types have therapeutic properties that lower our blood pressure, help us relax and provide other benefits that improve wellbeing of children, teachers, school administrators and visitors.
COMMUNITY ENGAGEMENT

EMPOWERMENT – Green schoolyards are places where children of all ages can gain experience repairing their own local ecosystems and make a difference in our world. They are places where collaborative environmental action leads to clear, positive results that counter Ecophobia and build our confidence in the power of working together—sending messages of optimism and hope to children and adults alike.

STEWARDSHIP – By transforming the idea of schoolyard “maintenance” into the broader concept of “stewardship”, school communities can become partners with their school districts and collaborate to reduce management costs while fostering increased parent involvement and community building.

Green schoolyards are a central piece of a wider vision to restore our relationship with the natural world. The time is right to invest much more significantly in our school grounds across the country. The green schoolyard movement has the power to bring nature to every child, every day while improving our local ecosystems, learning environments, and health.

School grounds can foster active and imaginative play onsite using natural materials and vegetation and by installing thoughtfully designed play structures that offer open-ended play opportunities and frameworks for child-driven games.

Small scale green schoolyard projects now exist around the U.S., showing incredible promise but generally lacking the larger scale investments that can help them to reach their full potential.

This is a call to scale up our green schoolyard work from coast to coast, and empower school districts to lead this paradigm shift with increased support from their communities, public institutions, local utilities, healthcare institutions and other like-minded organizations and partners.

Combining our resources in one place—school grounds—will multiply benefits for our cities and our children in the years to come. Is it hard? Yes, but we know where to start and together we can change our course.

Environmental city planner Sharon Danks is CEO of Green Schoolyards America, based in Berkeley, California, USA. She is a co-founder of the International School Grounds Alliance and the author of the book, Asphalt to Ecosystems: Design Ideas for Schoolyard Transformation. Her work transforms school grounds into vibrant public spaces that reflect and enhance local ecology, engage the community, and nurture children as they learn and play.
The movement to enrich outdoor learning environments on school grounds and connect children with nature took an important leap forward with the adoption of a California state resolution in 2014. The resolution encourages school districts across the state to design and construct schoolyard green spaces and use them to teach academic curricula outdoors. Authored by Assemblymember Phil Ting of San Francisco, the Living Schoolyard Month resolution (ACR-128) adopted on June 16, 2014, also established an annual statewide celebration of school grounds to be held each May.

Support for vibrant outdoor classrooms has been gaining momentum over the last few decades in California, across the USA, and around the world. California has been a national leader in the school garden movement since 1995, when then-Superintendent of Public Instruction Delaine Eastin collaborated with chef Alice Waters to create the Garden in Every School initiative through the California Department of Education. In 1999, the state established the Instructional School Gardens Program (AB 1014) to support garden-based learning. Over the years, tens of thousands of children have enjoyed school gardens inspired by these efforts, and learned firsthand about horticulture, nutrition and a variety of academic disciplines. To promote continued growth of these programs, California passed legislation in 2006 (AB 1535) that provided a total of $15 million in school garden grant funds for equipment, supplies, and related professional development for 3,500 school sites.

The 2014 Living Schoolyard Month resolution is an important milestone in California’s approach to promoting outdoor green spaces for all children in K-12 public schools and for the state’s thriving green schoolyard movement. Building on the success of previous school garden programs, it expands the depth and breadth of outdoor education beyond horticulture and nutrition to connect schoolyard greening to the health of urban ecosystems, child development needs, and the quality of life for students and their school communities.

**Connection to Schoolyards Abroad**

California’s adoption of Living Schoolyard Month holds great promise for children throughout the state and is also significant for the wider, international green schoolyard movement because it highlights the ongoing dialogue between efforts in California and those in other states and countries.

California’s resolution was strongly influenced by the *Westerbeke Declaration on School Grounds*, produced by a global nonprofit organization called the International School Grounds Alliance (ISGA). Written collaboratively by leaders in the school ground field from thirty-one organizations.
in seven countries, the *Westerbeke Declaration* expresses a vision for using school grounds to improve children’s well-being. The adoption of ACR-128 marks the first time the *Westerbeke Declaration* has inspired public policy, and it is hoped that the message it expresses will resonate with institutions in other states and countries in the years to come.

The annual celebration component of California’s Living Schoolyard Month is also intentionally aligned with ISGA’s annual May festival, International School Grounds Month, so students around the world will celebrate their school grounds simultaneously.

**HOW CAN YOU GET INVOLVED?**

Public support is very important to the success of green schoolyard programs. Whether or not you live in California, you can:

- Plan a project to enrich your schoolyard or assist a local school by volunteering on a schoolyard work day
- Organize events to celebrate and use your school’s existing green space
- Spread the word about International School Grounds Month and Living Schoolyard Month
- Recommend that your city government include schoolyard ecology as a component of their green city plans
- Encourage your school district to support ecological schoolyards and outdoor classrooms that improve children’s learning and play environments and enhance neighborhood ecology
- Put the activities in this *Guide* to good use with pre K-12 students at your local school
- Write about your May school ground celebrations and share them with us at: info@greenschoolyards.org (See page iv for details.)
- Join California’s statewide Living Schoolyard Network by contacting Sharon Danks, CEO, Green Schoolyards America at info@greenschoolyards.org

With your help to spread the word in California and around the world, celebrations of Living Schoolyard Month and International School Grounds Month will bring the benefits of green schoolyards to an increasing number of schools, and thousands more children will go outside to learn, explore and discover the world just outside their classroom door.

---

Art

Living schoolyards provide settings and inspiration for creative projects ranging from writing assignments to drawing, painting, mosaic, nature art, sculpture, music, dance and theater.

CREATIVE EXPRESSION Schools can diversify the recreational offerings they provide to students of all ages during their outdoor free time by including an array of inexpensive or natural visual art materials among their supplies. Unstructured “art time” allows students to get their hands dirty and express themselves creatively in ways that are not always possible during the rest of the school day. Schools can also provide supplies and encourage students to use their free time for their own writing, music, dance and theater projects.

OUTDOOR STUDIO Students of all ages benefit from art studio spaces that allow creativity to blossom—and that are easy to clean, comfortable, inviting and spacious. Living schoolyards can include formal or informal outdoor studios that increase teaching space for the arts and accommodate messier art forms that are more difficult to practice inside. Outdoor art studios can also include places to grow natural materials to incorporate into art lessons, and their settings can inspire other art forms such as creative writing and drama.

OUTDOOR EXHIBITS Outdoor art installations turn ordinary schoolyards into beautiful, memorable places that delight the eye and speak to the heart, while also showing students that the school community cares about their environment. Temporary and permanent schoolyard artwork can reflect local culture, highlight regional ecosystems and instill school spirit.

MAKE A CREATE-WITH-NATURE ZONE

AGES
3-18 years old

CONTRIBUTED BY
Zach Pine Nature Sculpture and
University of California Blake Garden
Kensington, California
www.naturesculpture.com
www.laep.ced.berkeley.edu/blakegarden

Make a Create-With-Nature Zone to support creative play and construction using found materials from nature. The Zone can be set up and used for a one-time Create-With-Nature event, or installed permanently in a playground or outdoor classroom to be used during recess with minimal supervision or to support instructional time. Create-With-Nature Zones usually have agreed-upon rules or expectations, sometimes printed on a sign.

MATERIALS

- Collect natural materials from school grounds, such as fallen leaves or twigs, or green waste from a school garden. Ask children to bring additional materials collected in an environmentally sensitive way, from home. Example materials include: leaves, rocks, sticks, flowers, cones, fronds, seeds, pods, wood, shells, evergreen needles, stalks, bark, seaweed, sand, mud and water.

- The size, types and amount of natural materials should be tailored to the age group and to the size of the Zone.

- A slight scarcity of materials can promote creativity, collaboration and sharing. Some materials can be kept in reserve to add in if needed.

- Tree stumps or rounds, to show the boundaries of the Zone and provide work surfaces or seating, can be obtained free-of-charge from tree service companies and public parks and gardens.

DIRECTIONS

- Create the Zone’s borders using chalk lines, tree stumps, benches, planters or existing walls and pathways. A cozy Zone promotes sharing, inspiration and collaboration.

- Include a “nature library” along the edge of the Zone to lay out and sort the natural materials. Bins or baskets are helpful to store, transport and collect items for use.

- If the Zone is not on pavement, provide a few flat surfaces such as stepping stones or tree rounds to highlight small objects that are less visible on grass, dirt or mulch.

- Orient students to the Zone. The purpose is to have fun while engaged in the activity, not to make something permanent. You can model this by making a creation, then quickly “recycling” it, making a new one from the same materials, and repeating this process a few times. You may introduce age-tailored vocabulary such as: under / over, symmetrical / asymmetrical, abstract / representational.

- You may want to make a “rule” that materials should be put back in the “nature library” at the end of a session. Make it clear whether foraging from nearby nature is encouraged or not, and what the expectations are for protecting the environment. If the Zone is permanent, post a sign explaining how the Zone should be used.

- The Zone can also be used as an outdoor classroom to achieve curricular goals in all subject areas, using structured activities and assignments.
**NATURE’S WATERCOLORS**

**AGES**
5-10 years old

**CONTRIBUTED BY**

Ayesha Ercelawn, La Scuola
San Francisco, California
www.lascuolasf.org

I

n this art activity, children grind leaves and flowers with mortars and pestles to extract their beautiful colors. They love the physical process of crushing plants and are intrigued to find that the shades of color emerging are not quite what they expected. This can also be a sensory activity if fragrant herbs are used, can connect to the botanical sciences in the classroom, be looked at through the lens of traditional art materials, or be used as an example of biodegradable and sustainable art materials.

**MATERIALS**

- Mortars and pestles (or small cups and sticks)
- Heavy paper such as construction or watercolor paper
- Paintbrushes
- Water in a small container
- Artist paint palettes
- Leaves and flowers

**DIRECTIONS**

- Demonstrate how to use a mortar and pestle by grinding four or five leaves with a few teaspoons of water. (Try this beforehand since some leaves work better than others.)

- Let the children gather leaves and flower petals from the schoolyard to try making their own colors. They can experiment with one plant material at a time or see what emerges when they combine different leaves or flowers. Try not to let them dump a lot of water in since the delicate colors will be too diluted.

- Have small pieces of paper available for children to test their colors and see if they like the shade they created or if they want to keep grinding.

- Share all of the students’ different colors by pouring a little bit of each child’s watercolor into a communal artist’s palette for all children to use, together.

- Finally, pass out heavy duty paper and let the students start creating their paintings!

**NOTES**

- To extend this activity, you can also provide strainers and containers to extract just the liquid color. These colors will keep for a few days in the refrigerator without spoiling, or you can study the process of spoiling (and discuss preservatives, refrigeration, etc.) by keeping them on a shelf to watch how the colors change with age.

- Many soils also make beautiful colors.
MANDALA
SUNCATCHERS

AGES
3-13 years old

CONTRIBUTED BY
Chicago Botanic Garden
Glencoe, Illinois
www.chicagobotanic.org

Loosely translated to mean “circle”, a mandala is a symbol that represents wholeness, reminding us of the connectivity of all things in the universe. The design is usually patterned levels around a central image, growing from the inside-out. For children it is a good exercise in conceptualizing the many levels of community (family, friends, school) and networks (neighborhood, city, world) around them, and how they are all interrelated.

MATERIALS
• Two pieces of square, plastic contact paper, per person
• Assorted pressed flowers and foliage
• Scotch tape
• Scissors
• Hole-punch
• Ribbon or yarn

DIRECTIONS
• Discuss traditional mandalas and suncatchers. Students forage for natural materials like flowers and leaves, aiming for about 30-40 pieces each, depending on size. If possible, dry and press these materials.
• Students receive one piece of contact paper, for size reference. Before using the contact paper, students design a draft of their mandala using natural materials.
• Next, students each receive tape and the second piece of contact paper. Students remove the protective sheet and place the contact paper sticky-side-up. Tape down the contact paper corners to ensure it stays in place.
• Students transfer materials from their drafts onto the sticky contact paper, then remove the tape from the corners.
• Starting from one side, slowly lay the remaining contact paper sticky side down on top of the designs, smoothing and pressing out air bubbles. Our class partners up for this part to make sure the design comes out as intended.
• Students cut off excess contact paper, staying about an inch away from their design.
• Punch a hole at the top, thread a piece of yarn through, and tie it off so that the finished product can be hung up.
• Students may want to hold their designs up to a bright light to show off their creations and describe the meaning behind their design or what their layers represent.
CREATIVE PAINTING WITH “GARDEN PAINTBRUSHES”

AGES
3-18 years old

CONTRIBUTED BY
Explore Ecology
Santa Barbara, California
www.exploreecology.org

Students search the schoolyard garden for two natural items to use as paintbrushes. After finding their own place to sit in the garden, students paint a picture using their “brushes”. Then all students come together, share their artwork, and discuss whether or not their paintbrush worked the way they thought it would and why.

MATERIALS
- Paper
- A variety of natural materials to use as paintbrushes
- Tempera paint
- Clipboards

DIRECTIONS
- Instruct the students to search the garden for two twigs, leaves, fruits or other natural items to use as their paintbrushes (about 5 minutes).
- After each student has found a paintbrush, give each person a clipboard, one or two pieces of paper and one or more cups with paint in them. Students can show each other their brushes while they wait for everyone to get settled.
- Instruct the students to find a place by themselves where they can sit peacefully and undistracted. Once everyone has found a comfortable place, ask them to close their eyes and detect smells or sounds around them. (30 seconds)
- Ask each student to create a painting inspired by their setting, or assign them to create a piece of art with a given natural theme. For example, ask them to draw their favorite place in nature. (10-20 minutes painting time, depending on age)
- If some students finish early, they can sit in their special spot and continue to observe nature around them. When the time is up, ask the students to gather and share their artwork. It is nice to have each student stand up, present their work, and describe what they painted.
- Complete the session with a discussion of the success or problems with the paintbrushes they chose. Explore why each paintbrush worked or didn’t work as expected.
USING IPADS TO TELL STUDENT-CREATED STORIES

AGES
4-8 years old

CONTRIBUTED BY
OAK Learning Center
at the Bay Beach Wildlife Sanctuary
Green Bay, Wisconsin
www.baybeachwildlife.com/kindergarten

Students tend to be curious about the environment. Part of this curiosity can be expressed through the development of stories about animals, plants, habitats, etc. In this activity, students take outdoor photos with an iPad, then use an app to create a story that includes both the photos and a corresponding audio file with a narrative. This works well with preschool students, since they do not write well enough yet to create a fluent written story.

MATERIALS
• iPad with an app such as StoryCreator

DIRECTIONS
• Students use the iPad to take photos of interesting things outdoors, like a rabbit den or a squirrel nest.
• At our school, the students were learning about what they need to survive—for example, food, water, shelter and space—the basic elements of a habitat. They learn that animals need these same elements. Students describe their homes, and are then instructed to build a shelter for an animal, in this case a rabbit den.
• Teacher and students discuss the shape and structure of the den, its size, any items to include, such as leaves for food or to act as bedding. Sand can be placed at the den’s entrance to capture animal tracks to see if a rabbit (or other animal) uses this shelter when the students are not around. Students compare and contrast their home with the rabbit den, and then explore the homes of other animals “in the neighborhood,” such as squirrel nests built high up in a tree.
• Our students took more photos of “the neighborhood” where their rabbit den is located, such as the squirrel nest and a nearby pond.
• We use the app StoryCreator to upload the students’ chosen photos. Each photo becomes a “page” in the storybook. There is room to type a caption for the photo.
• If preschool students are using the app, there is a feature which allows them to audio record their thoughts about each individual page of their story. For example, they might talk about the rabbit, where he lives, adventures with his neighbor the squirrel and how the rabbit likes to fish in the pond.
• Many literacy skills are practiced in the use of descriptive words, identification of the setting, sequencing of events, separating fact (e.g. rabbits need shelter) from fiction (e.g. the rabbit fishes in the pond), character development, and plot creation.
• In addition, the app allows the student’s own voice to become part of the story. This is a great assessment tool for teachers and a wonderful artifact of student work that can be shared with parents and family.
Students select a place in their schoolyard that they will visit once each season to draw or paint the plants and trees as they appear in that month, and then compare them to their drawings of the same place at other times of the year. Materials and techniques used can vary with the students’ ages.

**MATERIALS**
- Watercolor paints and paint brushes, colored pencils, crayons or oil pastels
- Paper suitable for painting or drawing
- One clipboard per student

**PREPARATION**
- Select a location in your schoolyard to act as a temporary art studio. Find a space large enough to seat the whole class on the ground, near plants with a variety of shapes, sizes and textures. Look for an area that includes deciduous trees or perennial shrubs that lose their leaves in the winter, flower in the spring, leaf out in the summer and/or change color in the fall.

**DIRECTIONS**
- Bring the class outside to the selected “art studio” and ask each student to find a comfortable place on the ground, near a plant or tree that they find interesting.
- Give each student a clipboard prepared with paper, and their own drawing or painting supplies.
- Ask the students to draw what they see using whatever type of drawing or painting technique is appropriate for their age. Younger students can focus on the basics of drawing from life and capturing the colors of the season. Older students may work on more complex techniques such as detailed scientific illustrations, perspective drawings or refined watercolor techniques.
- Ask each student to create two drawings or paintings: one that focuses on a plant detail, such as a small group of leaves or flowers, and another picture that shows a wider view, with the whole plant or tree in the image. Students can also try to represent the colors they see as accurately as possible.
- Revisit the same site and use the same drawing or painting techniques twice more during the school year, to capture seasonal changes in color and form, as they occur.
- When the third set of drawings and paintings are finished, display the artwork as an exhibit that illustrates the changing seasons on your school grounds.
PLACE-BASED ART INSPIRED BY ANDY GOLDSWORTHY

AGES
6-18 years old

CONTRIBUTED BY
Susan Hobart, Lake View Elementary School
Madison, Wisconsin
lakeview.madison.k12.wi.us

Our students collect natural materials from the schoolyard to create temporary story sculptures and framed art, drawing upon the character of the school environment. A gallery walk allows students to observe the art, tell his/her story and take photographs. Students return objects to the grounds and use the photographs to write a story. The stories and photos are displayed around the school or classroom.

MATERIALS
• Natural elements collected by students from the surrounding environment (leaves, rocks, branches, etc.)

BACKGROUND
• British artist, Andy Goldsworthy, creates site-specific art using primarily natural materials. Goldsworthy notes, “Design implies a sense of mapping something out, and then you follow the plan; [but] these things grow, and the process of making it parallels that of growth. It’s a lot more unpredictable, and with far more compromises with the day, the weather, the material.”
• This style of place-based nature art fits perfectly in the schoolyard. Students are growing and learning and will leave the school as they grow up. Their time in the school is temporary, and the art created in the environment, matches that idea: they are present today and can create from that mindset.
• Students are often corralled into planning projects. In Andy Goldsworthy’s style, going outside and free-forming creatively, students can go with their mood, use the objects that are available, and as they create the art, they can spin the story that goes with it.
• We adapted the “nature frame art” from an educator’s workshop at Community Groundworks, Madison, WI.

DIRECTIONS
• The art teacher presents Mr. Goldsworthy’s works and highlights his biography as an artist. (Use books or online materials to inform the teacher’s background.)
• Students and their teacher go outside to collect materials. The students then build sculptures or 2D art in an empty frame using the materials they found.
• When the pieces are complete, the students view each other’s work on a gallery walk, share their stories and talk about their pieces. This builds oral literacy and community.
• Students then discuss what exists in the schoolyard, making connections to natural systems and processes, and building environmental literacy. Next, the students photograph their art, for use in writing a story.
• The photographs and accompanying stories may be displayed in an art exhibition at the school.

BUBBLE POETRY

AGES
6-18 years old

CONTRIBUTED BY
Sarah Amador, Evergreen Elementary School
Rohnert Park, California
crusd.schoolwires.net/evergreen

The joy of blowing bubbles is timeless, felt immediately by people of all ages. The experience borders on the magical and whimsical. This English Language Arts activity allows students of all ages to access the power of metaphor and imagery by comparing their bubble to experiences, feelings and the world around them.

MATERIALS
- Bubble solution
- Bubble makers (or wire hangers, anything that can make a closed shape)
- Bubble containers
- Journals
- Pencils

DIRECTIONS
- What is metaphor? What is imagery? These are questions English teachers ask students every year. This Bubble Poetry lesson provides an easy, inexpensive and engaging way for students to apply these concepts to poetry.
- I like to ask, “What does the bubble compare to? Is it the earth? A ball?” One of my first grade students is in love with monster trucks, so of course he imagines his bubble to be a monster truck wheel rolling across the sky. It’s delightful to see students using their imaginations and being creative, not only with words but also with their bodies. Recently, my first grade students used their hands to make giant bubbles, quite successfully!
- Invite four or five students to blow bubbles. Encourage the remaining students to run and pop as many bubbles as possible. That’s the physical part of this lesson. If available, visit an adjoining park or run around a field. The more contact with nature, the better! Rotate the students who wish to blow bubbles, so that everyone gets a turn.
- Direct students to write poetry about their bubble using metaphor, imagery and adjectives. Encourage them to sit under a tree or find a quiet spot. A sentence frame for the first line might look like this, “My bubble is a [noun].”
- I’ve taught this lesson to all ages, from seniors in high school to first graders. All of them find themselves able to access the power of metaphor and imagery, by simply comparing the bubble to experiences, feelings and the physical world around them. Older students get to reconnect with their inner child, and witness the joyful laughter that bubbles spontaneously from the younger students.
POETRY IN THE GARDEN

AGES
8-18 years old

CONTRIBUTED BY
Openlands
Chicago, Illinois
www.openlands.org

Students explore the garden independently and write poetry to communicate their observations and reactions to being in the garden. As a wrap up, students share their poems with each other, and nominate poems for a class-wide poetry slam.

MATERIALS
• Pencils
• Journal or sheets of paper
• Clipboards (optional)

PREPARATION
• Walk through the garden space to ensure that it is ready for your students. Where will you be asking your students to go? Are there particular paths for them to stay on? Are there any defined borders?
• You may want to involve students in a different grade. If you teach fourth grade, connect with a first grade class, and go outside to write poetry together.

DIRECTIONS
• Explain that class will be held outside to write poetry.
• Ask students what kind of poetry they have written before. Begin with three prompts for students to use when writing poems. “Write a poem about: something you observe in the garden; anything that crosses your mind while in the garden, or anything else you’d like.”
• Students should record the prompts in their journals or on their blank sheet of paper.
• POETRY WRITING: Students bring writing materials outside with them. Students spend about 15 minutes writing their poems. Pick a meeting place for everyone to come back together when they are done.
• POETRY SLAM: Gather students into groups of three to four people to share poems with each other. Bring the class back together after about 10 minutes. Students nominate classmates to read their poems aloud in a Poetry Slam. Perhaps your school garden has a space that could act as a stage for the poet.
OBJECT MATCH CHALLENGE

AGES
9-18 years old

CONTRIBUTED BY
California Native Plant Society
Sacramento, California
www.cnps.org

This is a great, hands-on, introductory activity for biology classes that can be done with students in a schoolyard. The goal of this exercise is to help students learn to provide sustained, focused attention on the details of a plant (or object) they choose, and to learn to describe and record what they see, in detail. This activity is a natural fit for lessons about herbivore predation, adaptations, photosynthesis, diversity, cells, respiration and other biological topics.

MATERIALS
- Hard writing surface for each student (e.g. clipboard)
- Piece of paper and a pencil (or colored pencils) for each student
- Plant materials and other natural objects found in the schoolyard or local neighborhood. Fallen leaves work best, but a single leaf taken from a plant is also a good subject for study.

DIRECTIONS
- Set the challenge for the students. Give them a few minutes to find a natural object in the schoolyard to study during this exercise (a biological focus). Once they find their object, they will draw it using the entire sheet of paper. Their drawings should be:
  
  A = Accurate  
  B = Big  
  C = Clear  
  D = Detailed  
  E = Explained  

  These standards will set the tone for the students and allow their work to be compared to others in the class during a “match up” challenge at the end of the lesson.

- As the students are working, the teacher should review their progress and encourage them to add more detail, explanations, colors, dimensions and other subtleties of their object. This will help them to meet the “Explained” portion of the standard.

- When the students have finished their drawings in an allotted amount of time (20-30 minutes), gather the group back together in a central location.

- Ask the students place their papers in a circle on the ground, or on the perimeter of a table. Ask them to put their objects in the middle of the circle, but not near their own drawing.

- Once all of the students have added their papers and objects to the circle, ask the entire class to work together to match each object with the corresponding drawing.

- Debrief the class about which objects were the easiest to identify and match, and which ones were more difficult. What clues helped the students match their objects?

- Use the drawing standard to guide the discussion. Ask broad questions to bring out their curiosity about the focus topic. The discussion may also continue in the classroom.

When daytime temperatures in the winter fall below freezing, it’s time to go outside and make some beautiful temporary artwork with young children. This art project uses natural, local materials to create an ephemeral schoolyard art gallery.

**MATERIALS**
- Reusable plastic lids with rims, saved from large yogurt or food storage containers (one or two per child)
- Sticks, leaves, gravel, acorns, seeds, sand and other natural materials gathered by the children from their school grounds and/or in their own backyards
- Other natural materials such as fresh flowers with brightly colored petals, dried flowers or small seashells
- Empty egg cartons, muffin pans, or other containers for collecting and carrying small natural objects while hunting for them, outside (one for each child, if possible)
- Water, a small watering can, and a wide bowl
- Food coloring (optional)
- Twine made from a natural material (e.g. jute, cotton, wool), cut into 6 inch lengths and knotted to form loops.
- Protected outdoor location to allow projects to freeze
- Several rimmed cookie sheets or trays to carry artwork

**DIRECTIONS**
- Begin by bringing the children outside onto the school grounds on a crisp, clear winter day, when temperatures have been consistently below freezing. Ensure that each child is appropriately dressed for the weather.
- Give the children containers and ask them to explore the yard for 5-10 minutes to find and collect small samples of natural materials they see on the ground. Examples: sticks, leaves, gravel, acorns, seeds, sand, etc.
- Gather the children and their materials around an outdoor picnic table or a clear patch of level ground. Place the natural materials in the center, where everyone can reach them. Distribute one or two plastic lids to each child.
- Ask the children to arrange the natural materials in their empty lid to create a composition they find pleasing.
- When their compositions are complete, collect the plastic lids on the shared trays. Bring the trays to a protected outdoor location where they will not be disturbed.
- Guide the children in slowly pouring a small amount of water into their own lid, until it is filled at least ¼ inch deep. The water will slightly shift the lighter items. (Discuss which items float, which don’t, and why.) Add a few drops of food coloring, if desired. Place the knotted end of a loop of twine into the water at the edge of each piece.
- Allow the artwork to freeze, undisturbed. When the water is completely frozen, release the artwork from the lids by resting the bottom of each lid briefly in a warm pan of water. Hang the resulting frozen ornaments in the schoolyard to create a temporary outdoor art gallery.
WINTERBERRY WREATH

AGES
4-18 years old

CONTRIBUTED BY
KidsGardening
Burlington, Vermont
www.kidsgardening.org

The winterberry holly is native to eastern North America and grows throughout the US in zones 4 to 9. Winterberry is deciduous, dropping all its leaves during the fall season to unveil a densely packed assortment of bright red berries along its bare branches. These berries persist well into winter and feed many different species of birds. Its showy fruits also make winterberry an ideal plant for nature-made winter decorations.

MATERIALS
• Local natural area with shrubs that include berries (preferably winterberry)
• Hand pruners, wire coat hangers and floral tape
• Lightweight floral wire or thin aluminum wire
• Craft or masking tape

DIRECTIONS
• Begin by taking students on a journey to find established winterberry plantings in an area where you are allowed to collect. Winterberry shrubs thrive in saturated soil conditions with full to partial sun, often found along the edges of lakes and ponds. Take only what you need and leave plenty for the birds.

• After gathering your winterberry cuttings, prepare an outdoor area to assemble your wreaths.

• Encourage students to prune winterberry cuttings to similar lengths, about 6 to 8 inches.

• Reshape the base of each coat hanger into a circular form. (Adults can complete this for young children.) Secure sharp coat hanger ends with craft tape. This will serve as the base structure.

• Using lightweight floral or aluminum wire, secure the branches around the base hanger. As each branch is secured, overlap the next branch, tightly securing each branch to the base hanger. Keep adding stems until the hanger is fully covered.

• You can also add decorations such as flowers, ribbons, leaves or other greenery.

• Aside from making great wreaths, winterberry makes a bright addition to the winter landscape. If you’re adding them to your school grounds for the winter berries, keep in mind that the plants are dioecious, so the plants may be male or female. Only the female plants produce berries, and at least one male plant is needed for pollination and fruit-set. The best way to ensure you are buying a male or female plant is to purchase shrubs when flowers or berries are present.
Building a birdhouse (or bat house) is a great project. At Waldorf School of the Peninsula, students build a birdhouse in Grade 4 during the winter months. This activity helps develop coordination and introduces bird ecology.

**MATERIALS**

- Redwood fence boards, 1”×6”, 6’-8’ long (4.5 linear feet required per bird house), that are green and lightweight (not heartwood) with few knots and blemishes. It is best to use a wood that does not require treatment, including stains and oil.
- Small scrap wood to protect the birdhouse from clamps
- Nails: “5 Penny d” nails
- Hand-turned drills (two or three for the class), with bits for making the birdhouse hole and bits for the latch nail. The larger drills for making the birdhouse holes are more durable and the drill bits are larger and stronger.
- One per student: metal T-square rulers, small wood handled saw (type that cuts on the push and pull stroke), lightweight hammer, metal clamp, pencil
- Sawhorses, one per three or four students
- Safety goggles, one per student

**DIRECTIONS**

- Each type of bird requires a different type of house, with specific dimensions. Begin by researching what kind of birds you are hoping to house in order to select a species that lives in your area and to understand its needs.
- At our school, students are given one full class day to practice measuring, sawing and hammering on scrap wood before they begin. An alternative is to bring several adults for assistance.
- There are many good plans for birdhouses. Here is a link to the plans we use: http://bit.ly/1Ntow2X. At our school, the teacher learns to build the birdhouse and uses the plans for reference. We do not provide the students with copies of the directions but instead show them a finished birdhouse and ask them to deconstruct it in their minds. When helping a student with the next step, other students watch and see if they can then accomplish the task on their own.
- In the plans, you are directed to cut some of the boards down to 4 inches wide. Experienced students can cut the boards themselves if boards are first cut to the proper lengths.
- On nailing and finish work: Instruct the students to pull out any nails that are not true. Nails must be “flush” with the boards and the boards must be “flush” with each other, not showing large air gaps and mistakes. Cuts that are not straight must be fixed. Birdhouses are rasped, sanded and holes are patched with wood putty. Cracks are fixed with wood glue. Our goal is to make them beautiful as well as functional.
- Our students take the birdhouses home when everyone is finished, which encourages the students to support each other in finishing their work. If students finish early, they team up to build another one for the school garden.

Recreation

Living schoolyards encourage exploration, imagination, relaxation and free choice among a variety of recreational options, from ball games and climbing equipment to informal play in bushes, trees and flowers. They include space for traditional sports and games with rules created by adults, as well as places for children to dream up their own games and creative projects without adult involvement.

Rich, interesting, well-designed green schoolyard spaces invite children to climb and run and swing and balance, to dig and pretend and create. They lend themselves well to creative play with art materials, musical instruments and performing arts. Their planted areas invite kids to engage in open-ended “nature play,” find the little creatures that live in the soil, and unwind and explore “far away lands” with their best friend from the comfort of a cozy corner of the schoolyard.

School grounds can also become shared community resources after hours, providing multi-use, public open space within walking distance of every neighborhood. They are often the sites of annual school and community festivals and can be used creatively outside of school hours and on the weekends.¹

ACTIVITIES IN THIS CHAPTER

- Colored Water Exploration with Ramps
  Creative play / water / color blending (0-3 years old)
- Modular Obstacle Course
  Child-directed play / sensory integration (2-12 years old)
- Schoolyard Nature Loteria
  Board game / nature inspired art (6-17 years old)
- Birds and Worms: Camouflage Relay
  Active game / animal adaptations (3-10 years old)
- Jump the River
  Active game / coordination (4-7 years old)
- “Everybody’s It” Tag
  Active game / coordination (4-10 years old)
- Food Web Tag
  Active game / ecosystem connections (8-11 years old)
- Sierra Nevada Animal Olympics
  Active game / mountain ecosystems (8-11 years old)
- California Desert Animal Olympics
  Active game / desert ecosystems (8-11 years old)
- Steal the Native Plant
  Active game / plant identification (8-18 years old)
- You “Can” Cast
  Fishing game (8-18 years old)
- Photosynthesis Tag
  Active game / plant science (9-13 years old)
COLORED WATER EXPLORATION WITH RAMPS

AGES

0-3 years old

CONTRIBUTED BY

Mills College Children’s School
Oakland, California
millscollegechildrensschool.org

Water is often a pleasurable sensory experience for young children and provides unlimited opportunities for learning by supporting children’s social-emotional growth, eye-hand coordination, and language skills. This activity allows infants and toddlers to explore the various components of water that strengthen their cognitive and scientific understanding of gravity and color mixing. The children engage in both parallel and cooperative play as they explore how water moves through ramps.

MATERIALS

- 2-3 rain gutters, at least 4-5 feet long each
- Liquid watercolor paint
- Buckets, cups, and scoopers
- Water
- Sensory table and/or plastic bins
- Duct tape

DIRECTIONS

- This activity is easy to set up and requires few materials. First, find a shady and spacious spot in the yard. Next, attach a long rain gutter to the edges of a sensory table or plastic bin using duct tape. Connect the other end of the gutter to a second plastic bin (preferably a clear one).
- Fill the inside of the sensory table and bins with water and add a different color of watercolor paint to each one. Select two colors that will blend well.
- Our school finds it helpful to provide more than one gutter, as this allows the infants and toddlers more space to explore independently. Having multiple gutters also allows enough space for several children to comfortably access the materials, which reduces the potential for conflict. You can connect additional bins to the added gutters, or just allow them to rest on the ground.
- Provide buckets, cups, or scoopers for the children to use to pour the water.
- We often invite the children to help set up this activity. They enjoy choosing where the gutters should be taped and take turns holding the hose to fill up the water table and bins. When the children are involved in the set up of a curriculum project, they often take pride and ownership of the activity.
- When the activity set up is complete, ask a teacher to model how the colors can be mixed by scooping water from the sensory table and pouring it into the gutter connected to the bin with the second color. Highlight what changes when the colors are mixed. (Example: “When I poured the red water into the blue water, it turned purple!”) This is a great opportunity for providing descriptive language for the children.
- After modeling how the water can be poured into the gutters, step back and allow the children to explore, carefully observing their discoveries as they unfold.

Reference: Activity created by Betsy Hedges and Seferina Rivera.
MODULAR OBSTACLE COURSE

AGES
2-12 years old

CONTRIBUTED BY
Golestan Colab
Berkeley, California
www.golestankids.com/colab

In this activity students create their own modular obstacle course with a versatile set of materials. This activity is completely child-directed, never teacher-directed. By creating an obstacle course out of heavy movable parts, students develop core strength, agility and balance, while also learning to collaborate and create as a team. This further helps them develop executive functioning, social emotional, and problem solving skills. The obstacle course particularly helps students that are disregulated or struggle with sensory integration issues by providing a lot of opportunities for proprioceptive input from moving heavy things and participating in the course when it’s completed.

MATERIALS
- Any combination of: tires, straw bales, used large wire spools, ropes, cardboard boxes, hula hoops, trampoline, large wood slices, long 2x4 wood pieces, and/or tree stumps

DIRECTIONS
- Set materials out in the schoolyard. The larger, heavier to move items can be piled in a corner. Other items like the ropes and wood pieces can have a designated bin to which they will be returned after the activity.
- Explain to the students that they are going to be creating an obstacle course with the materials provided. Show them the materials they can use and allow them to examine them. Students can be encouraged to play around with the materials before they start making the obstacle course.
- Older students can plan the obstacle course collectively, maybe even map it out on paper. Good questions to ask to help guide the process are: What are the skills they want to test: Height? Balance? Speed? Coordination? Who are they designing the course for? How long is the course?
- After the kids have become familiar with the materials, they can create their own obstacle course. The role of the teacher is to give gentle guidance when needed. The teachers should not tell kids what to do or share ideas with them, rather help them to explore and find solutions.
- There is no “right” way to use any of the materials—the more creative and unconventional, the better. You can lend a helping hand when asked, but do not move heavy items for the students. This is a time to encourage teamwork and problem solving. For example, if a child is having a hard time moving a straw bale, you can suggest that s/he solicit the help of other children. If they still have a hard time moving it, you can initiate finding a solution by asking questions that will enable the children to problem-solve such as: “What can we use to move it?”
- Once the obstacle course is complete, the students can test it out and play in it. This is a good time for teachers to encourage trial and error to see how they can improve their obstacle course.
Lotería is a traditional game played in many Spanish speaking countries that is somewhat similar to bingo. Kids can make their own nature-themed lotería cards and tablas (game boards) using their schoolyard or backyard for inspiration. Teachers can help students to make a collaborative class set and/or personalized, nature-themed lotería games to take home.

MATERIALS
- To make one lotería set for the class, you will need at least two blank index cards per child, of any size. You will also need one full sheet of cardstock (8½” x 11”) per child, to use for the tablas.
- Drawing and coloring materials and glue for each child
- A class set of counting chips, for use while playing the game. This can be anything from bottle caps to beans or a favorite type of dried seed found in your schoolyard.
- To create the tablas (game boards), make photo copies of the hand drawn cards at a reduced scale (2” x 2.5”), and ask children to paste the small versions of the drawings onto their 8½” x 11” paper to create a grid of pictures, in random order, with four rows and four columns. (See photo) Each child will need sixteen small images for their tabla.
- Next, play lotería in the classroom or outside in the schoolyard. To begin, the leader holds the deck of cards and picks one card at random from the stack. He or she calls out the name of the card (as written) and shows everyone the picture. Children playing the game place a counting chip on the matching space on their tabla if their tabla has that image. The first child to cover four squares on their tabla in a horizontal, vertical or diagonal row (or fill four corners or a small square group of four) is the winner of the game and shouts “¡Lotería!” (Lottery!)
- Students can also work in small groups to make their own full set of place-specific lotería cards and tablas and use them to play with their parents and other members of the community, reinforcing the identification of nature in the schoolyard while spending time together in an enjoyable social activity that connects generations.

DIRECTIONS
- First, bring the class out into the schoolyard to explore, play and identify what they see! Ask the children: What kinds of trees grow at your school? Which animals visit or live there? Which insects? What type of plants do you see? Do you see birds, a lizard or a cat walking by? Ask students to make a list of everything they see, from the grass they can touch to the birds that fly away.
- Second, ask the children to draw what they observed, and make colorful pictures of the plants and animals in your schoolyard. They can pick other favorite objects, too. Give each student two cards. Ask them to draw one animal, plant or object per card and label each card with a descriptive name. If they know how to translate their label into Spanish, their cards can have both the English and Spanish words for the plant, animal or object they drew (e.g.: El Gato, The Cat). Ask Spanish-speaking parents or students to help with the translations. Visit the schoolyard as many times as needed to draw a full set of 54 cards (or more) with the class.

FOR MORE ABOUT LOTERÍA SEE:
Students participate in a relay race while learning how animals use camouflage skills for protection and survival to hide from predators or to sneak up on their prey. This can serve as the basis for further investigations into animal adaptations.

MATERIALS
- About 60 small objects in at least three assorted colors—biodegradable items such as pasta, dry beans, breakfast cereal, small pieces of yarn, or colored paper—to represent worms and bugs.
- Large flip chart paper and markers to track results
- Photos of various animals camouflaged by their habitat

PREPARATION
- Find a large open area outside and scout the site ahead of time to ensure there are no safety hazards or poisonous plants. Designate a relay space appropriate for the age group. Scatter equal numbers of each color of “worms and bugs” throughout the relay space ahead of time. Make sure to choose one color that is similar to the playing surface (green for grass, grey for asphalt, etc.).

DISCUSSION
- Ask students to name advantages of why frogs are green and snowshoe hares are white (to blend in with surroundings, such as leaves and snow). Ask if they know what this is called (camouflage).
- Have a discussion about why animals are able to hide from their predators (survival) or for predators to hide from their prey (element of surprise).
- Ask students if some animals change color in different environments or seasons. Give examples of this that are specific to your area. For example, a snow-shoe hare is white in the winter but turns brown once the snow melts.

DIRECTIONS
- Split students up in two to four equal-numbered teams and have them line up, relay style.
- Let students know that they are hungry birds and there are tasty treats scattered throughout the playing field. Describe what the “worms and bugs” look like (noodles, yarn, etc.) and ask them to predict what the best color will be for the environment they are in.
- When the teacher says “go” the first round of birds pick up the first worm or bug they see. When they return, the next person on their team does the same. Once the entire team has collected food, they all sit down. The first team to sit down wins that round.
- Next, teams place their “worms and bugs” on a large white paper and sort them by color. Students discuss what they found (mostly bright colors).
- After each relay, a record keeper tracks the colors collected and the amount of time it takes for each team to sit down. Conduct relay rounds until all small objects are found and track each time. Students repeat the sorting and recording process. During each consecutive round, it should take longer to find “worms and bugs”.
- What happened? Ask the record keeper to chart which colors were collected each time.
- Watch the activity demonstrated here: http://bit.ly/Birdwm
JUMP THE RIVER

AGES
4-7 years old

CONTRIBUTED BY
Playworks
Oakland, California
www.playworks.org

This fun jumping game brings play into the classroom. Teachers can integrate this game into lessons about rivers or ways people travel. During the activity, children learn and practice different jumping skills. The game can also be adapted for indoor use.

MATERIALS
- Jump ropes and chalk
- Optional: hula hoops, small logs or “found objects”

PREPARATION
- Arrange “obstacles” like sticks or small logs on the ground, or use jump ropes arranged in two lines, to create “terrain” for players to jump over. Obstacles can also be represented by chalked lines on the pavement. If you have an actual stream in the area you are using, that works well, too!

DIRECTIONS
- Explain to the children that they are taking a walk in the woods and may need to cross a stream or river. Ask the children to walk throughout the prepared space and when they come to a “river” (the objects or chalk lines on the ground) they need to jump over it without getting their feet wet. Children should work independently.
- When landing, children should land on two feet spreading their feet about shoulder width apart so they have a wide base of support when they land. After landing, children should proceed to and jump over the next river. Emphasis should be placed on landing on both feet at the same time without falling over.
- Indoor version: Ask children to draw or paint their own rivers on large sheets of paper. Securely tape children’s drawings to the floor and pretend that the class is going on a trip. When children reach the different rivers scattered throughout the room they must swing their arms and jump over the river, landing on the other side without falling over.
"EVERYBODY’S IT" TAG

AGES
4-10 years old

CONTRIBUTED BY
Playworks
Oakland, California
www.playworks.org

This twist on a classic game of tag will get kids moving and help develop their hand-eye coordination and spatial awareness. This activity is best for a large group of kids (ten or more).

MATERIALS
• No materials are necessary for this activity, but adult leaders should establish boundaries in a relatively small, safe area so that constant motion is encouraged.

PREPARATION
• Demonstrate safe tagging: light touch, like a butterfly’s wings, on the shoulder
• Explain and avoid unsafe tagging: hard contact that might cause the person being tagged to fall
• Review the boundaries and the consequences for going outside them. Students who go out of bounds will have their count started over from zero and will need to perform ten jumping jacks to get back into the game.

DIRECTIONS
• The object is for players to tag other players and keep a running count of everyone they touch in three minutes.
• No one person is “it” and no one stops playing or “freezes” when tagged.
• Variations:
  - Adjusting the length of the game and the location of the boundaries, between rounds, can add fun and variety.
  - If someone is tagged, they must subtract one from their running tag count.
FOOD WEB TAG

AGES
8-11 years old

CONTRIBUTED BY
The Greening of Detroit
Detroit, Michigan
www.greeningofdetroit.com

This version of tag is a fun and physical way to demonstrate how population dynamics within a food chain affect the sustainability of an ecosystem. Students act out the transfer of energy to different trophic levels by assuming roles as producers, herbivores, consumers and decomposers. Each “round” can be altered to emphasize various environmental conditions. Food Web Tag takes active learning to a whole new level!

MATERIALS
- Green, tan, red and white paper or cloth strips, twice as many as there are students
- Rubber bands

PREPARATION
- Students create colored cards (or strips of cloth) for each of the four roles: green for “producers”, tan for “herbivores”, red for “carnivores” and white for “decomposers”.
- You will need twice as many cards as there are students. To get the total number of each card, use the following percentages: 70% producers, 20% herbivores, 5% carnivores, 5% decomposers. This ratio reflects the make up of real ecosystems.

DIRECTIONS
- Identify a grassy area suitable for a game of tag, along with game boundaries.
- Introduce the four roles and their associated colors:
  - PRODUCERS: Avoid herbivores and decomposers. They can’t tag anyone.
  - HERBIVORES: Collect as many producer cards as possible while avoiding carnivores and decomposers.
  - CARNIVORES: Tag herbivores and collect their producer cards. They are chased by decomposers.
  - DECOMPOSERS: No one chases the decomposers and they try to catch (decompose) all other students.
- The teacher plays the role of the “sun”. Rather than having a steadily growing pile of “dead” students, you can give students another card after they’ve been tagged.
- Describe each role and the four card types to students, and emphasize that they must collect as many cards as possible to survive. When a student is tagged they give their card to the tagger and return to the ‘sun’.
- Give the producers a 10 second head start, followed by herbivores, carnivores, then decomposers.
- At the end, ask the students to count their cards. Any surviving herbivore with less than five cards dies of starvation.
- Experiment with the ecosystem in subsequent rounds. Increase the number of carnivores, remove decomposers, or alter the ratio of roles in another way.
- Discuss with students what happens when the ratio changes, and what this means for ecosystems.
SIERRA NEVADA ANIMAL OLYMPICS

AGES
8-11 years old

CONTRIBUTED BY
Yosemite National Park Education Office
Wawona, California
www.nps.gov/yose/learn/education

Animals in Yosemite have some amazing adaptations to help them survive. This activity helps students learn about some of these unique characteristics by imitating them and competing with their friends. Students will collect data to determine if humans have the same abilities as black bears, mountain lions, frogs, owls, or bighorn sheep! Teachers can emphasize concepts including adaptations and variation, the scientific method, data collection and analysis.

MATERIALS
• Masking tape
• Measuring tapes
• Stopwatches
• White boards and markers or pencils and notebooks for recording data/creating simple graphs.

PREPARATION
• Prepare each Adaptation Station with a leader and supplies. Students will rotate between the stations in small groups. Ask a leader at each station to introduce each animal adaptation and record the data.

DIRECTIONS
• Ask each small group to pick an Adaptation Station.
• Learn about an animal’s amazing ability and then try it!
• Measure and record the results for each student.
• Compare with the results within the group.
• Rotate to a new station and repeat the steps above.
• Debrief students at each station and at the end of the activity. Questions can include:
  - VARIATION WITHIN SPECIES: Did you have the same results as your friends for each task?
  - ADAPTATIONS: Why does each animal have its special ability? What was the most amazing ability you leaned about? What adaptations do people have to make us special?

ADAPTATION STATIONS
• American black bears can run at a speed of 35 miles per hour (or about 100 feet in two seconds). With masking tape mark off a distance of 100 feet. Use a stopwatch to measure each students’ time running 100 feet.
• Mountain lions can jump 25 feet in one leap from a standstill. Hold up a measuring tape perpendicular to the ground, and ask each student to stand next to the measuring tape one at a time and give their best jump.
• The great gray owl is the largest species of owl. They can be up to 33 inches tall with a wingspan of 60 inches! Ask students to stretch their arms out side to side, and then measure their “wingspans” fingertip to fingertip.
• Sierra Nevada bighorn sheep are an endangered species that live high on the rocky peaks of Yosemite’s mountain ranges. Make a “tightrope” made of masking tape with periodic distance markers, and see how far each student can tiptoe on this “narrow ledge”.
• The highly endangered Sierra Nevada yellow-legged frog breathes not just through their mouths but also through their skin, allowing them to stay underwater for minutes or even months when hibernating. Use a stopwatch to measure how long each student can hold their breath like an underwater frog!
The Mojave Desert might not seem like an inviting home, but some animals have adaptations that help them thrive in the hot dry climate. This activity helps students learn about these unique characteristics by imitating them and competing with their friends. Students will determine if humans have the same abilities as mountain lions, kangaroo rats, roadrunners and ravens. This can be a “jumping off point” for studies of adaptation, variation, the scientific method, data collection and analysis.

MATERIALS
- Masking tape
- Measuring tapes
- Stopwatches
- White boards and markers or pencils and notebooks for recording data/creating simple graphs.

PREPARATION
- Prepare each Adaptation Station with a leader and supplies. Students will rotate between the stations in small groups. Ask a leader at each station to introduce each animal adaptation and record the data.

DIRECTIONS
- Ask each small group to pick an Adaptation Station.
- Learn about an animal’s amazing ability and then try it!
- Measure and record the results for each student.
- Compare with the results within the group.
- Rotate to a new station and repeat the steps above.
- Debrief students at each station and at the end of the activity. Questions can include:
  - VARIATION WITHIN SPECIES: Did you have the same results as your friends for each task?
  - ADAPTATIONS: Why does each animal have its special ability? What was the most amazing ability you learned about? What adaptations do people have to make us special?

ADAPTATION STATIONS
- **Mountain lions** can live in the desert mountains, as well as the Sierra Nevada. They have the amazing ability to move quietly and quickly. Divide students into pairs. Ask one student to close their eyes as the other student tries to slowly and silently sneak up and tap them on the shoulder.
- People need water every day, but the **kangaroo rat** never has to drink. They are named for their giant kangaroo-like feet. They are about 4.5 inches long and can jump up to 9 feet! That’s about 24 times the length of their body. Set a measuring tape on the ground, and ask each student to stand next to the measuring tape and give their best jump. Ask: If you were a kangaroo rat, how far could you jump?
- The **roadrunner** can run 20 miles per hour (or about 100 feet in 3.5 seconds) With masking tape, mark a distance of 100 feet on the ground. Use a stopwatch to measure each student’s time running 100 feet.
- **Ravens** can live almost anywhere, from the hottest deserts to the coldest mountains. They can also imitate other animals or even people. Ask students to listen to the sounds around them for 30 seconds and pick one to imitate.
STEAL THE NATIVE PLANT

AGES
8-18 years old

CONTRIBUTED BY
Center for Land-Based Learning
Winters, California
www.landbasedlearning.org

This game is modeled loosely after “steal the bacon”. Teams of students learn to identify native plants and then compete with other teams to be the first to tag the correct plant when called. This game promotes team building, helps students hone their plant identification skills, and encourages students to run.

MATERIALS
• Three to seven different native plants (either growing in pots, or cuttings you’ve taken from mature plants)
• Plant identification cards or field guides with information about the native plants (one set for each team)
• A large, flat area, safe for running

DIRECTIONS
• Create two to six teams with equal numbers of players, up to six in each team. Give each team time to learn all the plants by looking carefully at each one, describing its unique characteristics using the field guides.
• Assign each person in each team a number from one to six, depending on the size of the teams. If you do not have the same number of people in each team, you can give one person two numbers. (For example, if you have three teams of six and one team of five, you can give one of the people in the team of five two numbers to be responsible for.) Each team should have a #1 person, a #2 person, etc.
• Arrange all of the players into two lines, opposite each other, and declare these to be the starting lines. Place one plant of each species on the center line, between the players.
• Call out the name of a plant and then a number. If you called out Toyon #2, for example, the #2s from each team would run to the centerline and try to be the first student to touch the Toyon. Calling the name of the plant first, before calling out the number of who will go touch the plant, makes all the students think about which plant that is, instead of just the students whose number you called. The person who touches the plant first, wins a point for their team. You can play until a team reaches a specified number of points, or until all the plants and numbers have been called.
• Remind players that they must be aware not to harm the plants or each other. Be aware that students will be running toward each other from multiple directions and possibly looking down at a plant instead of up at each other.
• You can choose to place multiple plants of the same species in the center to allow multiple students to find the correct plant. You can also call out a unique characteristic of a plant instead of the plant’s name.
YOU “CAN” CAST

AGES
8-18 years old

CONTRIBUTED BY
Project F.I.S.H.
East Lansing, Michigan
www.projectfish.org

In many areas of the world, people do not have access to rods and reels. They fish using a hand line where line is spooled in their hand and the line is cast by tossing the hook/bait out into the water. Once a fish is on the line, they just pull the line in with their hands. “Can casting” is a similar technique and a few people in the U.S. use this technique to fish.

MATERIALS
- Aluminum pop/soda cans rinsed out, one per student
- Monofilament line (8-10 pound test)
- Practice casting plugs (or rubber erasers)
- Casting targets, e.g. cardboard, rope or buckets
- Duct tape
- Safety glasses, one per student
- Rope or chalk to mark a casting line on the ground
- Optional: Backyard Bass casting game

PREPARATION
- Find an open area, at least 12 feet by 12 feet. Students bring in their own cleaned can. Designate the area with a line on the ground that is not to be crossed. This will prevent participants from moving in front of other casters. If an item gets stuck in the “casting area”, nearby participants will stop to allow safe retrieval.

DIRECTIONS
- Ask students to attach fishing line to their can by tying or taping it to the can’s tab. The line’s length shouldn’t be longer than the space available, about 10-12 feet. Students wind the line around the can and attach a casting plug to the loose end of the fishing line.
- Demonstrate how to hold the can by grasping the can in your hand below the wound line. A finger or a thumb can be used to stop the line from unwinding. Be sure the participants do not have their hand covering the line because it will stop it from unwinding. Allow the casting plug to hang freely an inch or two from the can.
- Demonstrate the motion that you would use to throw a ball underhand, let the line spool off the end of the can while you continue to hold onto the can. Set out large targets and pass out safety glasses to all who are going to cast. Targets should be close at first, then after some practice, targets are moved farther and made smaller.
- Another technique is to throw the plug out. Practice hitting different targets, using different techniques and positions.
- Once students have practiced, they count how many targets they hit after ten casts. The ten casts are not intended to be competition, but a self-evaluation.
- Fishing can start discussions about history, ecology and pollution, nutrition or other topics.

Adapted by Mary Riley MSU 4-H youth development programs from the National 4-H Sportfishing Curriculum. Developed by Sharon Rushton, SR Enterprises.
PHOTOSYNTHESIS
TAG

AGES
9-13 years old

CONTRIBUTED BY
Los Angeles Unified School District
Office of Outdoor and Environmental Education
Los Angeles, California
www.outdooreducation.org

In this activity, students learn about the components and process of photosynthesis while practicing cooperative learning skills and playing a game of tag. The game explains the ingredients necessary for plant survival. The object is for the “trees” to get everything they need in order to make glucose (earn a sweet treat) and survive.

MATERIALS
• Green, yellow, blue, brown and red string
• Bag of small, sweet, edible treats

DIRECTIONS
• Explain the concept of photosynthesis and the process by which leaves create energy for plants.

• Show the students the collection of string and explain what each color stands for: yellow for the sun, blue for water, red for carbon dioxide (CO₂) and brown for nutrients. These are the components needed for a tree to survive.

• Choose a few students to be the “trees” in this game of tag, so approximately one person in six is a “tree”. Give each “tree” a green string to tie on their wrist in a manner that is easily released. The “trees” will be the only ones who can try to snatch the other students’ strings.

• Once the “trees” have been selected, have the other students choose which photosynthesis components they would like to be. Note: allow the students to choose whichever component they would like to be, even if all of them choose the same color. This can be discussed at the end of the game.

• Ask the “components” to tuck their strings into their back pockets or the back waistband of their pants. They should not tie the string on their body in any way. The hanging strings will look like a tail. The object is for the “trees” to get everything they need in order to make glucose.

• To play the game, the “trees” chase the “components” and try to snatch their “tails”. Once a “tree” has everything needed to make glucose they take their catch to the leader and explain what they have collected. The students cannot just hand the strings to the leader. They must explain what each color represents. Once the student (“tree”) has answered correctly, give them one treat. Round one should last about five minutes.

• When the first round is over ask the students to sit down and discuss what happened in the game. Did one or more “trees” survive? Why or why not? (In order to survive, they must have had at least one treat.) If most students chose “water”, discuss what happens during floods. Explain that if there is too much of something, like water, the trees cannot survive. Trees get uprooted, nutrients get diluted or washed away.

• Play a second round. Choose different students to be the “trees”. During the second round, if a string gets taken, the student can get another string of any color and keep playing. As “trees” turn in their components, add another “tree”. Do not tell the students at the beginning of the round that more trees will be added, they will begin to see what happens as “trees” turn in their components. This can be discussed during the wrap-up. This round should also only last about five minutes.

• At the end of round two discuss the results. What happened when there was an unlimited amount of components? How many trees survived? What would happen if the game continued?
Health

Green schoolyards foster children’s mental and physical health and well-being by providing settings for curiosity, imagination, exploration, wonder and adventure.

IMPROVED WELL-BEING Studies have shown that many types of green spaces have therapeutic properties that lower blood pressure, reduce stress and provide other benefits that improve the mental health and well-being of children, teachers, school administrators and visitors.

SENSORY EXPLORATION Living schoolyards stimulate our senses and provide opportunities to engage the whole body to develop children’s sense of balance and coordination, and reinforce sensory integration. This is helpful for all children, and can be particularly useful for children with special needs. Enriched school grounds are also a “feast” for the eyes, ears, nose and (sometimes) mouth, and provide endless textures for curious fingers to explore.

PHYSICAL ACTIVITY Living schoolyard environments offer child-driven, play-based solutions to obesity problems. They also provide places for students to be physically active during physical education classes and while participating in sports and other organized fitness games.

HEALTHY LIFESTYLE Green schoolyards can promote healthier lifestyles through nutrition-oriented gardening and cooking programs. They are also places to learn new outdoor skills that foster lifelong health such as proper tool use, safety at the water’s edge, shelter building, and camp fire management.

ACTIVITIES IN THIS CHAPTER

- Your Special Path
  Sensory exploration / nature walk (2-18+ years old)

- Senses and Sorting Nature Exploration
  Sensory exploration / sorting (3-6 years old)

- Outdoor Sensory Activities
  Sensory integration (3-14 years old)

- Multisensory Garden Tour
  Sensory exploration / science lesson (4-8 years old)

- Herb Bundles
  Sensory exploration / smell (5-12 years old)

- Shades of Green
  Sensory exploration / vision (6-12 years old)

- Herbal Tea Bags
  Sensory exploration / taste / smell (7-18+ years old)

- Sound Maps
  Sensory exploration / hearing (8-12 years old)

- Jump Rope Activities
  Physical activity / game (5-18 years old)

- Plant Part Relay Race
  Physical activity / game / plant anatomy (8-10 years old)

- Why Eat Colorful Rainbow Food?
  Healthy lifestyle / nutrition / sharing food (4-9 years old)

- Outdoor Survival
  Healthy lifestyle / outdoor skills / fire (10-18 years old)
YOUR SPECIAL PATH

AGES
2-18+ years old

CONTRIBUTED BY
Nature Explore
Lincoln, Nebraska
www.natureexplore.org

Take a walk in nature with children. Explore and let your senses go to work. Make mental notes of things most interesting to you. Later you will make a “map” of your special path. This activity supports a wide range of ages, interests, and abilities. Children are able to develop skills and understandings in many areas of development at the same time as they engage in personally meaningful explorations of the world around them.

MATERIALS
• Clipboards
• Writing and drawing materials
• Books and resources such as atlases and maps can be used to spur interest in this topic.

PREPARATION
• Identify a good location for a walk in nature with students. This could be somewhere on your own school site, or nearby in the neighborhood. Areas that have a variety of terrain features are useful for this activity. Look for a place that has hills, some vegetation for cover, and different surfaces like grass, rocks, water, or bridges or other structures. Easily recognizable landmarks are helpful, such as a unique tree or a pond.

DIRECTIONS
• Bring the class to the natural area and introduce the activity to find and explore their own special path. Remind children that the path they create should not disturb the natural area. (e.g. avoid breaking branches, etc.)

• Allow the children to take a walk and hunt for interesting things. As the group explores, ask them to let their senses go to work. Listen, look, smell, and feel this environment! Encourage them to make mental notes of things that interest them. Observe the details. Try a variety of perspectives… climb a tree or pretend to be a bug on the ground.

• Bring the group back together and ask the students if anything they touched or smelled reminded them of another time or place they have been outdoors? Hold a discussion with the group about what they experienced.

• Now, give the children some drawing materials and ask them to make a map that is representative of their walk and the things they experienced along the way. The map may have symbols or lines representing a path, or landmarks drawn on it. It can convey a sense of the physical place as well as their feelings about their experiences there.

EXTENSIONS
• Remember that this type of walk in a natural area does not have to be strenuous, just interesting. Find a natural area that is wheelchair accessible and lead this activity with children or adults who have mobility differences.

• Try making different types of “maps” on repeated trips. Children can convey their experiences along their path using descriptive words and poems, or they can describe their journey with movements that they act out.
SENSES AND SORTING NATURE EXPLORATION

AGES

3-6 years old

CONTRIBUTED BY

Lake Erie Nature and Science Center
Bay Village, Ohio
www.LENSC.org

Help very young children explore their place within nature by leading them in this quick and easy sensory activity. This exploration uses the five senses to encourage mindfulness in nature, reinforce counting, sorting and to introduce children to native animals. Use this exercise on a nature hike or on a “field trip from the sidewalk” in any season.

MATERIALS

• Outdoor area with some natural elements, such as leaves, acorns or rocks, that can be counted

DIRECTIONS

• Lead your students outdoors to the most “natural” area available. A wooded area is ideal but any area near where animals may live is appropriate.

• Tell students that today they are going to use their senses to explore the world around them. The first sense they will use is sight. Ask students to point to the part of their body that they see with. Ask the following questions and allow time for responses:

  - Look up, what do you see?
  - Look down, what do you see?
  - Look right, what do you see?
  - Look left, what do you see?

• Repeat the step above for hearing, smelling and touching.

• Guide students in listening for natural sounds, identifying colors such as the color of the sky, trees, grass, rocks. Point out any native animals or plants that you are knowledgeable about. Encourage students to close their eyes and touch nature (grass, rocks, tree, plants) and describe how they feel. Remind students not to taste anything in nature unless their parents instruct them to.

• If the season and area allows, encourage children to collect acorn tops and bottoms. Show them how the top fits with the bottom and ask them what animals live here that might eat acorns. Encourage students to leave the acorns for the squirrels, leaving nature the way we found it. Include a focus on math by counting the acorns as they pile them up.

• Repeat this activity at different times of the year so that students can see the changes that occur in nature with the change of seasons. You can also invite students to collect rocks and acorns for a sorting exercise, which can be used to introduce the idea of living versus nonliving things for older students.
Humans learn by using our senses, but as children, we all have distinct abilities to integrate sensory input. Children with Autism Spectrum Disorders, ADHD and many other children with no diagnoses commonly experience these differences. This set of activities is designed for all children to better integrate sensory input. These movements are especially useful for children with sensory integration differences.

**BACKGROUND**

- Because of sensory integration challenges, some children actually avoid the discomfort of crossing their midlines. You might notice that they “get stuck” in mid-reach for something and switch hands to continue what they are doing. They might also move their whole trunk toward the opposite side rather than crossing over or reaching with one arm. How can this impact learning? Children with poor mid-line crossing sometimes avoid tracking their eyes as they read from the left to right. They may also shift their whole body or the paper instead of writing across their midlines. Practice crossing the midline can actually help develop neurological pathways to make it more comfortable for kids.

**DIRECTIONS**

- **WATERING AND WATER PLAY.** Holding a heavy watering can or a hose with two hands will make children cross the midline. “Painting” with water on a sidewalk or brick wall can also help kids cross the midline. It’s also helpful to ask kids to paint on vertical surfaces.

- **RAKING.** Ask kids to rake leaves or soil, alternating using their dominant and non-dominant hands. Raking usually requires pulling the rake across one’s midline.

- **SHOVELING.** Shoveling, too, requires pulling one’s arms across the midline. Ask kids to shovel, then ask them to switch how they might normally shovel, using their non-dominant hands to lift the shovel rather than guide it, or whatever seems less “comfortable”. This stimulates the brain to practice integrating input.

- **CLIMBING.** Kids generally cross their midlines while climbing, and trees are the perfect platform to get that integration going. Climbing walls or playground structures will work, too, but trees offer more random spacing of hand and foot holds, and kids benefit from the visual and tactile variety of trees’ irregular textures. Watch how kids climb trees: How often do they have to use a right hand to cross over to a branch on their left? How often do they bring their left foot across the midline to step on a branch on the right?

- **SAND PLAY.** For pre-K children, simple tasks like using their hands to draw a big infinity sign in the sand can help them to cross the midline. Driving cars around a large, lateral figure-eight path works, too. For older children, digging and piling sand will most likely involve a lot of crossing over the midline. Set up a treasure hunt where children lie on their stomachs and uncover items have been buried in the sand. Make sure they have to reach across to the opposite side to uncover the treasure.

- Some of these activities may feel uncomfortable to kids with sensory differences. While any of these activities are happening, remind kids to take big, deep breaths. Teach them to use their breathing to gauge how they feel, stopping when needed to take a deep breath and center themselves.
MULTISENSORY GARDEN TOUR

AGES
4-8 years old

CONTRIBUTED BY
Chino Basin Water Conservation District
Montclair, California
www.cbwcd.org

No matter our age, gardens innately awaken our senses. They provide the perfect setting to engage students’ senses and subsequently build a sense of place, mindfulness, and connection to the outdoors. This loosely structured sensory activity allows students to use their power of observation to explore and play in their schoolyard garden. In the Multisensory Garden Tour, children will actively engage with their schoolyards as scientists, stopping at predetermined areas to record and discuss observations using each of their senses.

MATERIALS
• One per student: Clipboard, pencil, worksheet with five sections (one section for each sense)

DIRECTIONS
• Review or teach the five senses to students, emphasizing that scientists use all senses when developing an understanding of the world around them. Instruct children not to pick anything from the garden without asking, especially not for eating.
• SIGHT: Ask students guiding questions such as, What is the furthest thing you can see? What’s the closet thing you can see? What might the garden look like from the eyes of squirrel, a butterfly, an ant…? Provide time for students to write or draw observations of the garden. Challenge them to draw what the garden may have looked like 500 years ago or 500 years in the future.
• LISTENING: Instruct students to sit silently for 10-20 seconds with both arms in the air, listening carefully to the sounds of garden. Ask them to count each garden sound they hear by raising a finger. When they open their eyes, ask them to compare and share their observations with their neighbor. What sounds were distracting? Which were caused by wind? Water? Animals?
• TASTE: Remind students not to taste anything unless it’s a good choice for your class. Provide an opportunity for students to explore the schoolyard and list, draw, or discuss which plants they think may be tasty or edible. Introduce guiding questions such as: How is taste a helpful sense? Challenge students to find evidence of foraging or grazing and hypothesize what the consumer might have been.
• TOUCH: Ask the students to find two contrasting plants that are distinctive to the touch. A soft lamb’s ear compared to a succulent provides excellent contrast and offers an opportunity to discuss plant adaptations. Compare and contrast how the plants feel and why certain plants have different textures.
• SMELL: Prompt the students to find their favorite fragrance in the garden. Then have the students pair up, show, and discuss their favorite scented plant. Provide guiding questions about why different scents may help a plant.

EXTENSION
• Ask students to draw a picture or write a creative story about their schoolyard garden from the sensory perspective of a small creature or insect.
Children explore using their senses and create a scented herb bundle to remember their discoveries.

**MATERIALS**
- For each child: provide a piece of fabric cut into 4 to 5 inch squares and a rubber band
- Activity requires an area containing plants with fragrant leaves which children can collect

**DIRECTIONS**
- Review the five senses. Explain to the children that they will explore the leaves in the area using their senses.
- Discuss: How might we explore this space with our senses? Which sense might we not use today? The sense of taste, unless an adult says we can.
- Take a moment to observe leaf shapes and colors and to notice sounds in the area. Then demonstrate how children can carefully touch the leaves to feel the leaves’ textures and then smell their hands to experience each plant’s scent.
- Allow children to explore the area for a few minutes, then ask them each to find one plant whose scent they like and stand next to it. Help each child carefully collect two to three leaves from the plant, using one hand to support the stem while carefully pinching off the leaf with the other.
- Gather the children in a circle and distribute the fabric. Have children place their leaves in the center of their square and then wrap the fabric around the leaves, pressing the leaves into the center. Distribute the rubber bands and help children wrap the rubber band to close the bundle.
- Ask the children to offer one word to describe the scent of their bundle. If there is a good variety of plants, have children trade with a partner, smell the bundle and then try to find the plant whose leaves are inside. Remind them that gently squeezing the bundle will help release the scent of the plant even after the leaves have dried.
SHADES OF GREEN

AGES

6-12 years old

CONTRIBUTED BY

Herb Broda, Ashland University
Ashland, Ohio
www.movingtheclasoomoutdoors.com

This activity challenges students to discriminate among many shades of the same color and it also gets kids outside taking a very careful, micro look at their surroundings.

MATERIALS

• Strips of paper approximately 3 inches wide and 18-24 inches long (Old manila file folders are great for this.)
• Masking tape

PREPARATION

• It helps to use a paved area or outdoor tables as your home base for distributing the sticky materials. This activity also works best on a day when the wind is relatively calm.

DIRECTIONS

• Working in pairs, students collect small samples (about thumbnail size) of differing shades of green they find in the schoolyard. Usually, I ask pairs to bring in twelve to fifteen samples. As the groups return, give each pair a cardboard strip that has a piece of masking tape fastened sticky side up along the entire length. The group’s task then is to look carefully at the samples collected and arrange them from lightest to darkest on the cardboard strip. After the strips are completed, lay them on the ground to create a color gallery.

• This activity is wonderful for developing an attention to detail and works especially well if you limit the “search area” to a small space. The nearest green space right outside the schoolhouse door works just fine. The grasses and weeds in an average lawn are great for this activity. Be sure to emphasize that only a sample the size of a thumbnail is needed. Help students see that many leaves have different shades of green on the top and bottom.

VARIATIONS

• This activity can really be used at any time of year. Although the spring and summer months are ideal to search for green, the fall is great for orange or red. In winter, look for shades of brown.
**HERBAL TEA BAGS**

### AGES
7-18+ years old

### CONTRIBUTED BY
Ithaca Children’s Garden
Ithaca, New York
ithacachildrensgarden.org

Herbs are such versatile and useful plants. They make their way into our everyday lives through the foods we eat and drink, the medicines we use, and the bouquets and fragrances we enjoy. Even if you don’t grow fresh herbs, their tastes and aromas can be explored in their dried form. A great hands-on way to experience herbs with all your senses is through herbal teas.

### MATERIALS
- Coffee filters
- Scissors and staplers
- Baker’s twine or string
- Cardstock scraps
- Markers or colored pencils
- Dried herbs such as: chamomile, nettle, catnip, anise, cinnamon, mint, bee balm, rose hips, lavender, lemon balm, blackberry leaf, or other herbs you enjoy
- Bowls and spoons
- Hot water, mugs or teacups
- Optional: freshly picked herbs, twist-ties, mesh produce bags or paper bags

### DIRECTIONS
- Pour dried herbs into bowls. Set a spoon next to each. Write the name of each herb on a scrap of card stock and place it underneath the bowl so it is out of sight.
- Ask the children to use their senses to explore the herbs. Smell, taste, touch. Ask if they can identify any by sight, smell or taste. What happens when you smell two herbs mixed together?
- Reveal the herbs’ names and place the labels next to each bowl. Encourage the children to design a blend of herbs that appeals to them. They can use the scrap paper to record their ingredients.
- Flatten out a coffee filter and use scissors to cut 0.5” - 1” from each side, turning the circle into a rectangle. Add about a tablespoon of your blend of dried herbs to the middle of the coffee filter. Fold the long sides in so they overlap and cover the herbs in the center of the filter. Fold it in half, bringing the long ends together. Tap gently so the herbs settle to the bottom. Fold the open top down two times and use a stapler to secure it.
- Cut a length of baker’s twine. Staple it to the top of the tea bag. Use scrap card stock and markers or colored pencils to design a tag for your tea bag and give it a name. Use a stapler to attach the tag to the end of the string.
- Repeat until each child has made at least a few different tea bags, so they’ll have one to taste and one or more to share.
- Now enjoy the tea! Steep the tea bags in mugs of hot water for 3-5 minutes. Let it cool and sip away.

### EXTENSION
- DRY YOUR OWN HERBS: If your school grows herbs, ask permission to harvest some for drying. Harvest mid-morning after the dew has dispersed and before the sun evaporates all the newly formed essential oils.
- Bundle the herb stems loosely with twist-ties. Using twist-ties allows you to tighten the bunch easily as it dries and shrinks. Hang the bundles upside down in a dry place.
- Wrap a mesh produce bag or a paper bag with some holes punched in it around the herbs once they begin to dry, to catch any dried leaves that fall from the stems. Use the herbs for the activity above when they are completely dry.
Sound Maps

Ages
8-12 years old

Contributed By
Life Lab
Santa Cruz, California
www.lifelab.org

Students listen to the world around them and map the sounds they hear to help them develop their sense of hearing and awareness of their surrounding garden space.

Materials
- A simple, blank map of your school garden or grounds, 1 copy per child
- Drawing materials for each child
- Clipboards, to facilitate drawing outside (optional)

Directions
- Take the class outside to your school garden, or another quiet/reflective space on the school grounds. Gather the group in a circle and ask everyone to be quiet for a few moments. Begin the activity by asking: “Does anyone hear a sound they can’t identify? Any guesses about what might be making that sound?”
- Select a special word that the teacher/leader will use as a trigger for the activity. When students hear this word, instruct them to fall silent for five minutes, or another length of time that is age appropriate.
- Ask each student to pick a “Magic Spot” to sit alone or with one friend in the garden/grounds. Send them to their chosen spots and say the special word to begin a short period of silent reflection.
- While they are sitting silently, ask the students to listen for any sounds they hear, no matter how quiet. When they hear a sound, ask them to draw a picture or write a note on their map indicating where the sound came from and what they think it was.
- After five minutes, gather the class back together and encourage students to share their maps. Ask questions like these to guide the discussion:
  - Did any of you hear the same sound? Did you identify it as the same object, or did you have different ideas of what was making that sound?
  - Did anyone see something making a sound?
  - What was the loudest noise you heard? The quietest?
  - How were the sounds different in the first minute and the last minute of our quiet time?
- After the discussion, combine all of the students’ observations on a large map of the school garden or grounds to create a sound map of your site.
THE AMERICAN HEART ASSOCIATION IS WORKING TO HELP KIDS, FAMILIES AND COMMUNITIES LIVE HEART-HEALTHY LIVES. USE THIS PHYSICAL ACTIVITY INFORMATION TO HELP STUDENTS GET ACTIVE AND STAY ACTIVE, FOR LIFE.

MATERIALS

- Jump ropes
- Jump rope skill cards from Jump Rope for Heart (See: http://bit.ly/1QYWrSx)

BACKGROUND

- For both children and adults, increased physical activity is associated with an increased life expectancy and decreased risk of cardiovascular disease. Physical activity produces overall physical, psychological and social benefits.
- Inactive children are likely to become inactive adults. Physical activity helps with controlling weight, reducing blood pressure, raising HDL (“good”) cholesterol, reducing the risk of diabetes and some kinds of cancer, and improved psychological well-being, including gaining more self-confidence and higher self-esteem. Physical activity should be increased by reducing sedentary time. It should be fun for children and adolescents. Parents should try to be role models for active lifestyles and provide children with opportunities for increased physical activity.

DIRECTIONS

- Included (left) are two jump rope activities for school children sourced from the American Heart Association’s Jump Rope For Heart. Follow the directions on the cards to teach children a variety of jump roping patterns and games. This is a time when children can establish the foundation for movement skills. These are also the years when positive experiences can establish a positive attitude and appreciation for participating in daily physical activity for life.
- Jump Rope for Heart promotes the value of physical activity to elementary school children while showing them they can contribute to their community’s welfare.
PLANT PART RELAY RACE

AGES
8-10 years old

CONTRIBUTED BY
Community Alliance with Family Farmers
Davis, California
www.caff.org

In this activity, students connect the foods they eat to the six parts of a plant while being physically active. It requires an open space with even ground for kids to run and can be adapted for a 15-25 minute time slot.

MATERIALS

- At least 50 cards printed with different types of produce
- One sign for each plant part: root, stem, leaf, flower, fruit, seed
- Six containers
- Diagram showing all six parts of a plant

BACKGROUND

- Plants have six primary plant parts: roots, stems, leaves, flowers, fruits and seeds. The produce items we eat can be classified by plant part. For example, carrots are roots, spinach is a leaf, zucchini is a fruit and a broccoli crown is made up of flower buds.

DIRECTIONS

- The class will be divided into two to three teams, depending on the number of students. To set up the race, divide the cards evenly among the teams and place them at each team’s starting line. Attach each plant part sign to a container and set them a good distance from the starting line.
- Ask students to sit in a circle so they can all see the teacher. Display a diagram of a plant showing the six plant parts. Ask students to explain what each plant part does or why it is important. The discussion should include the following ideas:
  - LEAVES gather sunlight for photosynthesis in order to create food for the plant.
  - FLOWERS contain the reproductive parts of the plant. Fruits and seeds are produced after flowers are fertilized through pollination. Some flowers rely on insects, animals, wind or water for pollination. Bees are the pollinating insects we hear about the most. We wouldn’t have many of the fruits we eat without the help of bees!
  - FRUITS develop from fertilized flowers. Fruits are the outer covering that protect the seeds. They can be fleshy, (apples, tomatoes) sometimes dry or hard (walnut shell).
  - SEEDS contain the embryo for a new plant and a food supply that the embryo uses to sprout.
- Explain that the students’ job is to think about which plant part we are eating when we eat a particular type of produce. For the relay race, they will sort cards displaying things we eat into the correct plant part category. Show the group a few examples to practice.
- Divide the students into teams. Line them up and review the rules. The first person picks up a card and works with his/her team to decide which plant part it is. The person with the card skips or hops to the corresponding container, puts the card in the container, then skips or hops back to tag the next person in line. Keep playing until the cards run out.
- Encourage the children to work with their teammates! Once finished, ask the students which cards were the hardest to sort. While they watch, go through a few cards in each container and discuss whether each item fits or whether it should be placed under a different plant part category.
**WHY EAT COLORFUL RAINBOW FOOD?**

**AGES**

4-9 years old

**CONTRIBUTED BY**

Trinity Gardens  
Santa Barbara, California  
www.trinitygardenssb.org

Children learn about the nutritional benefits and tastes of colorful, fresh produce snack food through this activity. Together they build a food rainbow from fresh produce. They then taste a prepared rainbow food snack at a community table. The group may also be involved in planning, planting and harvesting from a rainbow shaped children’s garden.

**MATERIALS**

- Large basket of colorful, whole produce; one per child
- Additional fresh produce, cut up for each child’s finger food rainbow snack (Optional: hummus for dipping)
- Laminated food rainbow color word cards, in English and other languages, as desired
- California Dept. of Education’s laminated food cards (or assorted seed packets, magazine or calendar pictures)
- Compostable paper plates, cups and napkins
- Hand washing station
- Painter’s canvas tarp or old sheet, with colored bands each 10-12 inches wide, to create a “food rainbow”

**DIRECTIONS**

**PART I. Rainbow Mat Activities (about 20 minutes)**

- Ask students to sit around three sides of a rainbow painted floor mat; position teacher on the fourth side
- Discuss: “Why eat a FOOD rainbow?” Use charts, books and/or a song to introduce and reinforce that each food color helps our bodies grow in special ways.
- Students echo: “Red helps my heart,” “Orange helps my vision,” “Yellow helps my skin,” “White supports my good health (immune system),” “Green gives me stronger bones and teeth.” “Blue and purple help my brain to remember (memory).” (Note: see additional information online about the health benefits of vegetables and fruits.)
- Distribute whole produce to each student. Invite those holding red vegetables or fruits to place them on the rainbow mat near the matching color word. Help students identify each type of produce and discuss how each color helps our bodies. Repeat for each color.
- Review and summarize: “What have we learned about the importance of eating different colors of fresh food?”

**PART II. Eating the Food Rainbow (20-30 minutes)**

- Ask students to wash their hands, set the table and sit down to have a snack using the cut produce.
- As they try each type of food, review healthy food concepts and discuss flavors. Encourage students to try foods for the first time. The teacher models by eating each item.
- Compost leftover food and paper. Write in journals about food tasting experiences.
- Contact Trinity Gardens for free seeds to plant a rainbow garden as a follow up project.

**OPTIONAL RESOURCES**

Books (ages 4-8): *I Can Eat a Rainbow* (Annabel Karmel);  
*Growing Colors* (Bruce McMillan); *Eating the Alphabet* (Lois Ehlert)

Books (ages 8-12): *Blue Potatoes, Orange Tomatoes* (Rosalind Creasy), *The Vegetables We Eat* (Gail Gibbons)
OUTDOOR SURVIVAL

AGES
10-18 years old

CONTRIBUTED BY
Wisconsin Green Schools Network
Columbus, Wisconsin
www.wisconsingreenschoolsnetwork.org

Through inquiry and field investigation, students build outdoor survival skills. They learn how to start a fire using a magnesium fire starter and tinder, and about the importance of teamwork as they decide what fuel to use and how to structure their fire in order to increase their chance for success. Students are also given a scenario in which they must build a debris shelter, explain their shelter design, and reflect on what they have learned in the process.

MATERIALS
• Each student: Food, water bottle, weather-appropriate clothing and footwear
• Each group: First aid kit; kindling, tinder, logs found on-site; magnesium fire starters

PREPARATION
• Divide students into groups of three to four people. Find a location in nearby woods. Review general field safety and weather appropriate field gear with students.

DIRECTIONS
• BUILDING A FIRE: Review general fire safety and discuss first aid. Provide students with a magnesium fire starter. Use an inquiry approach and ask how students can start a fire with the equipment available and the fuel types and sizes (tinder, kindling, logs) they need to keep it going. Ask students to design a structure to sustain their fire (examples: teepee, log cabin).

• The instructor should visit each group to discuss fire safety, the use of a magnesium fire starter, and their fire structure plan. The instructor should approve plans before students attempt their campfire. Students should begin working on starting and keeping their fires going.

• At the end of the activity, ask students to reflect on their fire structure and maintenance, and on teamwork. Be sure the fire is properly extinguished before leaving the site.

• DEBRIS SHELTER: Ask students about our basic needs for survival (food, water, shelter and space). In a survival situation, it is important to prioritize their needs. Tell students to imagine that they are stranded in the woods, far from civilization without any means to contact others, and the weather is taking a turn for the worse. What should they do? Students realize that they need to build a shelter to protect them from the storm. Give students plenty of time to construct their shelters.

• When all shelters are complete, tour all the shelters with the entire group. At each shelter, ask the team to explain their engineering and design rationale about location choice, materials and architecture. After reviewing the shelters, ask students to meet in their small groups to debrief the experience, exploring questions of form and function, such as whether or not they felt their debris shelter would withstand the elements.

CONCLUSION
• Transition to a discussion about how they built their fire and shelter and mention other things to consider when trying to survive in the wild. When might this skill come in handy? Ask them how their experience during this activity influences how they would build a shelter in the future? Emphasize the power of positive thinking and remaining calm in any emergency situation.
Enriched school grounds are ideal places to foster positive, healthy relationships among children, between children and adults, and between people and the environment. Research tells us that nature has a therapeutic influence on our mental and physical health, so an environment filled with trees, shrubs, flowers and wildlife is a helpful starting point to set the stage for social and emotional learning that build empathy and collaboration.

**EMPATHY** Living schoolyards help schools foster an atmosphere that emphasizes care for one another, care for all living things, and care for the Earth. They provide settings that teachers can use for lessons that range from understanding one another’s feelings to valuing the great diversity of life that shares our world.

**COLLABORATION** Nurturing enriched school ground environments—and our communities—is best accomplished through collaboration, built on strong, positive relationships. Living schoolyards provide opportunities to practice and hone communication, teamwork and stewardship skills, while providing balance for other aspects of school life that are more competitive.³

### ACTIVITIES IN THIS CHAPTER

- **Tree Wonder**  
  Empathy / trees / art / writing (5-9 years old)
- **The Tree is Like Me!**  
  Empathy / trees / physiology (5-10 years old)
- **Lighthouse**  
  Communication / cooperation / game (8-12 years old)
- **Exploring Our Relationship to Place**  
  Collaboration / relationships / empathy (9-18+ years old)
- **Team Building: The Amazing Winter Race!**  
  Collaboration / cooperation / game (10-18+ years old)

### OTHER RELATED ACTIVITIES

- **Modular Obstacle Course**  
  Collaboration / child-directed play (2-12 years old)
- **Outdoor Survival**  
  Collaboration / outdoor skills (10-18 years old)
- **Finding Your Place in the World**  
  Empathy / nature / observation skills (3-18 years old)
- **Family Campout in the Schoolyard**  
  Collaboration / team building (6-18 years old)
- **Create an Insect Hotel**  
  Collaboration / stewardship / empathy (3-18 years old)
What’s going on with trees in winter? This activity teaches your students about geometry, shapes, scale and nature. You may also add a journaling or drawing component. The activity is ideal for going outside, even if for a short period of time, and is best done in winter months so tree branches can be seen. The activity can be adjusted for the age or grade level of your students.

**MATERIALS**

- Paper or notebooks
- Writing or drawing materials
- Protractors for older students
- Optional: blankets to sit on

**BACKGROUND**

- Winter is the perfect time to observe trees without leaves, and appreciate their stark beauty. It is also easier to observe bird and squirrel nests, as well as the difference in the shape, size and scale of branches.

**DIRECTIONS**

- Take a few moments before going outside to talk with your students about the life cycle of trees and the winter season. What is the difference between deciduous trees and evergreen trees? Deciduous trees lose their leaves in winter, because they need sunlight and warmth to grow. In winter, with less sunshine and colder days, deciduous trees “hibernate” until springtime warmer weather causes them to sprout new leaves.

- Bundle up and take along a blanket to sit on, if you like. Find an area with at least one tree, and ask the students to sit down a little distance away and observe the tree quietly.

- What do they notice? Are there any nests in the tree? Any leaves left on the branches? Were there any birds or other animals in or around the tree? Ask them to look at the size and shape of the branches, and note how they get progressively smaller.

- After a few minutes, ask the students to move closer to the tree and touch its trunk. What does it feel like? Is it different than other trees in the area? What is on the ground around the tree?

- Ask the students to write or draw pictures about their observations. For older students, ask them to draw the branches of the tree so they can measure the angles with a protractor later. This part of the activity can be done in as little as 10-15 minutes.

- Ask students to form small groups and share their observations. Depending on their age, students may write or draw a story about the tree.
THE TREE IS LIKE ME!

AGES
5-10 years old

CONTRIBUTED BY
TreePeople
Beverly Hills, California
www.treepeople.org

Comparing ourselves to trees might appear silly but, if we take a look we find that we are quite similar. Bodies correlate to trunks, blood to sap, arms to branches; we begin to see a resemblance. What about our needs? Water to drink, air to breathe, food to eat; recognizing these similarities help us tune in to the natural world in a unique way. We will be able to see that “the tree is like me!”

MATERIALS
• Butcher paper or other mural size paper
• Crayons or markers
• Fallen tree leaves

DIRECTIONS
• Take students out to see a tree and ask, “What would it be like to be a tree?”
• While laying underneath the tree, instruct the students to close their eyes. Lead them through a visualization that has them imagining their toes reaching down into the warm soil to become roots... their arms reaching up toward the sun to become branches... their hair and finger tips sprouting leaves... and their body strong and straight and covered with bark. Continue the visualization to imagine water soaking up through their roots; carbon dioxide coming into their leaves and releasing oxygen; birds landing on their branches; spreading their branches to create shade; and more.
• Ask students to open their eyes and share experiences.
• Next, have students lie down on a sheet of mural paper in the classroom or outside. Trace around their bodies, creating individual life-size images. Ask students to add their face to the drawing and then to make the rest of their body look like a tree: body=trunk, hands/arms=branches, skin=bark, hair/fingers=leaves, feet/toes=roots.
• Invite students to draw animals on their Tree/Me image and glue fallen leaves on their branches.
• Ask students, “What are the similarities between our bodies and the structure of a tree?” “What else do you think people have in common with trees?” (e.g. blood is like sap; similar needs for food, water, air, etc.)
Lighthouse

AGES
8-12 years old

CONTRIBUTED BY
Life Lab
Santa Cruz, California
www.lifelab.org

This activity asks one student (the lighthouse) to verbally lead another blindfolded student (the boat) through a maze of people. This pairs well with class discussions around communication and cooperation skills.

MATERIALS
• Blindfold

DIRECTIONS
• Ask a student who feels that he or she can communicate clearly to be the lighthouse.
• Ask another student who considers himself or herself to be a good listener to be the boat. Blindfold this student.
• The remaining students will become obstacles in a bay. They can be bridges, logs and so on. It is important that they are quiet and do not move during the activity.
• Situate the lighthouse at one end of the playing area.
• Place the boat at the other end.
• The remaining students can take their places between the boat and the lighthouse as obstacles in the bay.
• The task of the lighthouse is to verbally lead the blindfolded boat through the obstacles. The lighthouse should remain stationary. The lighthouse should give the boat explicit directions so that it will avoid the obstacles. It may help to have the boat keep a hand raised to assist in determining left from right.
• The task is completed when the boat safely arrives at the lighthouse. If the boat hits an obstacle and sinks, choose another student to be blindfolded, rearrange the obstacles and begin again. The obstacles should remain still and silent.
• Possible discussion topics after this activity:
  - How did it feel to be the boat?
  - What did the boat have to do to stay afloat and reach the lighthouse?
  - How did it feel to be the lighthouse?
  - What did the lighthouse have to do to bring the boat in safely?
  - What does “concentration” mean?
  - What does “communication” mean?
EXPLORING OUR RELATIONSHIP TO PLACE

AGES
9-18+ years old

CONTRIBUTED BY
Occidental Arts and Ecology Center
Occidental, California
www.oaec.org

This activity examines our relationships with place, people, all living beings and the “things” we interact with each day, building and re-learning ecological literacy. “Eco” comes from the Greek word oikos which means home. Ecology is the study of home. Economy is the management of home. Ecosystems are the web of connections at home. This place-making activity sets the stage for long term observations of the ways in which we are in a relationship with home.

DIRECTIONS

• Stand in a circle in the schoolyard. The facilitator supports participants in establishing the cardinal directions by instructing, “on the count of three, point to where the sun rose this morning.” Ask participants to hold their pointing arms still while they look around at the varied responses. Ask two or three people to provide an explanation of why they are pointing in the direction they chose, highlighting observation, memory and gut feeling as common responses.

• Without revealing the answer, use the participants’ co-created knowledge to establish the cardinal directions. Once group has established N/S/E/W, “create” (or imagine) an oriented, flat map on the ground with clear boundaries, an equator and a center point. You may draw a line in the dirt (or use chalk on asphalt) or use reference points to establish boundaries.

• Participants will soon physically place themselves on the map according to their personal responses to the facilitator’s prompts. Acknowledge that scale will vary depending on the question. After each prompt is (silently) responded to through physical motion, ask three to five participants to tell the group where they are. Set the pattern by asking students to introduce themselves and share their response with a brief story, if appropriate. The student sharing their response then calls on the next student. The facilitator monitors the discussion and prompts with the additional questions.

• Sample prompts for this mapping activity include: Place yourself on the map where you call “home.” Place yourself on the map where—to the best of your knowledge —your mother’s ancestors are from. Place yourself on the map where—to the best of your knowledge—your father’s ancestors are from. Place yourself on the map where you first felt a connection to the natural world. Place yourself on the map where some of the materials in your cell phone were extracted. Place yourself on the map where your shirt was made. (Ask a partner for some help in reading the tag.) Place yourself on the map where your favorite food is from. Place yourself on the map where you would like to travel one day. Design your own prompts in order to meet the needs of your community.

• To debrief, stand in a circle. Raise your hand if you: liked that exercise; were ever confused during that exercise; learned something about yourself/the group during that exercise; had to travel during that exercise; felt heard during that exercise; have more stories to share.

• DISCUSSION PROMPTS: What came up for you? What did you learn about your community? Surprises? Similarities? Differences? How are we all connected? To each other? To land? To food? To water? What networks did you observe? What systems connect us?

• SUMMARY: This activity is about building community amongst participants (unexpected commonalities and differences) and rooting our personal experiences in deeper relationship with place in order to better understand home. We are global citizens.
TEAM BUILDING: THE AMAZING WINTER RACE!

AGES
10-18+ years old

CONTRIBUTED BY
Wisconsin Green Schools Network
Columbus, Wisconsin
www.wisconsingreenschoolsnetwork.org

Students work on team cooperation as well as fuel their competitive spirit as they race through challenges during the winter season! Winters can be long in Wisconsin, but there is never a shortage of great opportunities within a short distance of the school doors.

MATERIALS
- Large open area, markers, flags and GPS units
- Stop watches, clipboards, data recording forms, utensils
- First aid kit and drinking water
- 30 feet of rope, two buckets and a sled
- Board snowshoes: Two 8-foot long 2x4 boards per team

PREPARATION
- Create teams of five students each. Prepare a written overview of the team challenges and where each event will take place. Give stopwatches, clipboards and data recording forms to each of the event judges. The goal is for a group to have the lowest overall time while working effectively as a team.
- Students can help make board snowshoes by drilling five holes in each board about 18 inches apart, along the center. Pull 36 inches of string or rope through each hole and tie large knots on the bottom side.

DIRECTIONS
- SLED PULL: Every teammate must take a turn pulling a single member of their team in a sled down the course and around a cone placed about 50 meters away. Repeat the activity until each member of the team has taken a turn pulling their teammates and being pulled across the finish/start line.
- FIVE-MAN SNOWSHOE WALK: The Five-man Snowshoe Walk uses board snowshoes. The challenge is for the group to create a method to successfully move their team from the start line to the finish line in the most efficient way possible.
- GPS SPRINT: Locate spots on the school campus where you can send students to look for hidden flags. Use the GPS to mark the “waypoint” at each spot and record those coordinates. With the marker and flagging, give that site a number and then hide the flag so it cannot be seen from far away. Give students a GPS and set of coordinates. Ask them to enter the coordinates into a GPS unit, and use the “where/go to” feature to assist them in finding and returning the hidden flag to the starting line.
- SNOWBALL THROW: The object of this challenge is to have each member of the team make a snowball and throw it into two buckets that are placed 10 feet away. If snow is not available, use marshmallows as a substitute.

The team that has the fastest overall time and best teamwork for all events is your winning team!

CONCLUSION
- Engage teams in a discussion to reflect on these events. What worked well and didn’t work well? What led to a team experiencing success and what detracted from success? How was effective leadership demonstrated? When was successful follower-ship demonstrated? How does this activity relate to other activities?

Schoolyard Agriculture and Food

In our increasingly urban society, people of all ages have become disconnected from the natural and agricultural environments that sustain us. Starting a school garden is one way to reconnect students and school communities with local agricultural and ecological systems and to create new, vibrant, hands-on learning environments at the same time.

HORTICULTURE Culinary gardens are cost-effective, hands-on learning spaces for studying natural science, botany and horticultural techniques. Gardens are commonly used to teach lessons on topics such as soil, weather, plant growth, insect life cycles and decomposition.

ANIMAL HUSBANDRY School gardens can provide an opportunity to introduce children to farm animals on a daily basis. Chickens are the most common, but some schools also raise bees, ducks, rabbits, sheep, goats, ponies and other animals. The animals provide opportunities for children to practice stewardship and empathy, and improve their nutrition, and their waste helps to enrich the garden’s soil.

SHARING FOOD Edible gardens give students of all ages insight into where their food comes from, what it takes to produce it, and the art of bringing it to the table in an enjoyable manner. Preparing and sharing food in the schoolyard is easier to do if schools build informal outdoor kitchen spaces with ovens, camp fires, or barbecues, sinks and picnic tables.

CURRICULUM CONNECTIONS School gardens can also be springboards for topics in many disciplines. They help bring social studies and history lessons to life, and provide engaging settings for teaching arithmetic and geometry, health and nutrition, art and music, reading and foreign languages.1

ACTIVITIES IN THIS CHAPTER

GROW HEIRLOOM WHEAT: SEED TO FEED

AGES
4-12 years old

CONTRIBUTED BY
Trinity Gardens and Center for Regenerative Agriculture
Santa Barbara and Ojai, California
www.trinitygardenssb.org and www.ojaicra.org

While learning where their food comes from, students use simple approaches to grow, harvest, thresh, winnow and grind wheat into flour. This can be used to make bread, tortillas, muffins or pancakes. Ideally, fresh produce grown in the school or community garden accompanies this activity for a well-rounded meal. Young children are introduced to the curriculum through the classic story, The Little Red Hen. Kids also plant seeds for the next wheat crop.

MATERIALS
• Hand grain mill (suggestion: Victorio Deluxe Grain Mill)
• The Little Red Hen – any version that suits the student group
• Wheat seed (suggestion: heirloom White Sonoran wheat from Native Seeds)
• Small, dark paper or plastic plates, one per child
• Recipe, ingredients and equipment for cooking with flour
• Bread Comes to Life, by George Levenson, optional
• Red Hen puppet, Folkmanis, optional
• Smooth pebble for each child, about 2.5 inches, optional

DIRECTIONS
• Arrange a schoolyard growing space. Use The Little Red Hen book to introduce the “Seed to Feed” wheat growing project if you are working with young children. Young children become excited when asked, “Would you like to help the Little Red Hen with her wheat?”

• Older students can learn about grain by doing research, to gain historical perspective and scientific knowledge. Examples of grain varieties may be obtained from a local garden or farm, and grain seeds can be found in bulk bins at a health food store or acquired at a local seed bank, seed swap or nursery.

• Plant wheat seeds in a weed-free, prepared garden space and cover with approximately 1/3 inch soil in rows about 6 inches apart, with 2-3 inch spacing. After growing into 6 inch tall clumps of grass, thin the plants to about 6 inch spacing. Students delight when discovering the first seed heads, and then observe the maturing plants changing to a lighter green, then golden brown. Hand water the wheat, or use drip irrigation. Stop watering when the wheat begins to turn light brown.

• Thresh the wheat when it is fully mature. First, dry the seed heads, cut them off with scissors, and place them into harvest baskets. The seeds can then be separated from the seed heads in several ways: 1) stomp on a pillowcase full of seed heads; 2) smash an individual seed head with a smooth rock; 3) winnow the seeds by hand. To winnow seeds, students blow the chaff away from a plate containing smashed seed heads. This leaves just the seeds which can then be poured into the mill. After the wheat is milled, it becomes flour and can be used in a cooking project. Set some seeds aside for planting the next wheat crop.
SAVING SEEDS WITH CHILDREN

AGES
4-18 years old

CONTRIBUTED BY
Grow Your Lunch, LLC
San Francisco, California
www.growyourlunch.com

Saving seeds preserves genetic diversity for generations to come and completes the life cycle of school garden plants. Keep in mind that not all plants in the garden will produce viable seeds, as many are hybrids whose offspring will not exhibit the same traits as the parent plant. The basic principle to successfully saving seeds is to let the seeds dry completely (or “senesce”) on the plant before trying to save them. If the seeds are not completely dry, they will be prone to rot once stored. If you want to learn more about seed saving, read Suzanne Ashworth’s book Seed to Seed.

MATERIALS
• A screened drying rack or stainless steel cookie sheet
• Stainless steel bowls
• Mason jars with holes punched in the tops
• Sticky labels

DIRECTIONS
• Before you begin, identify the plants in the garden that are ready to have their seeds saved. The seeds will be dry and ready to fall to the ground. Select plants that have not cross-pollinated with others, unless you are trying to save hybridized seeds. Refer to Seed to Seed for more detailed seed saving guidelines.
• Pick the pod, seed head or other part of the plant that contains dry seeds and place them in stainless steel bowls.
• Find a comfortable place to sit and “thresh” the seeds. (Rub the seeds out of the other plant material, or “chaff.”) Remove any remaining plant material by blowing over the seeds. (This is called “winnowing.”)
• If the seeds are completely dry, place them in the mason jar and label it with the date the seeds were saved, the name of the crop and the variety. Store in a cool, dark, dry place.
• If the seeds are not completely dry, spread them out on the drying rack and place it in a well-ventilated area, out of the sunlight, where it will be safe from animals until the seeds are ready for storage.

EASY SEEDS TO SAVE
Herbs: parsley, dill, fennel, cilantro/coriander
Lettuce
Legumes: beans, peas
Grains: wheat, barley, oats, quinoa, amaranth
Annual flowers: sunflowers, poppies, hollyhocks
PLANT ROOT EXPLORATIONS

AGES
6-10 years old

CONTRIBUTED BY
Hidden Villa
Los Altos Hills, California
www.hiddenvilla.org

In this two-part activity, students will study roots in the schoolyard and make a viewing box to study roots over time. Plant roots absorb water and nutrients and anchor the plant in the ground. Roots are typically found below the ground, but sometimes grow above ground to absorb water and nutrients from the air. There are many different types of roots including taproots, fibrous roots, cauline roots and tubercular roots. A taproot is a long central root that stores energy while firmly anchoring the plant. Fibrous root systems usually grow less deep but can extend a great distance to allow plants to find water and nutrients in a wider area. Cauline roots spread easily and help a plant cover a wide area (e.g. ivy). Tubercular roots, found on plants such as the sweet potato, grow out of the stem, branch, leaves or old woody root.

PART 1: EXPLORE ROOTS IN THE SCHOOLYARD

MATERIALS
- Garden trowels and gardening gloves (optional)
- 1 milk container (school lunch size) for each student

DIRECTIONS
- A great way to encourage students to explore different kinds of roots is to have them weed a portion of the schoolyard such as a garden pathway or other weedy playground space. Select a large, well-defined area to work on that does not contain any plants you want to keep. Clearly mark the boundaries of this selected area before you begin.
- Bring students outside and explain the activity. Demonstrate how to pull the weed by the stem base, as close to the ground as possible, so that the roots come up cleanly and remain intact. Use trowels as needed to loosen the soil.
- After students remove the plants from the ground, they should gently shake off the extra dirt and observe the roots they have in hand. Designate a space for students to put the weeds they find. Discuss the range of root types the class discovered.

PART 2: CREATE ROOT VIEWING BOXES

MATERIALS
- 1 clear plastic square (1.5” x 1.5”) for each student, cut from transparency sheets or similar sturdy, clear plastic
- Scissors, tape, drawing paper, pencils
- Soil, seeds (e.g. sugar snap peas or radish), water

DIRECTIONS
- Preparation: Wash the milk cartons and open the flaps. Mark a 1” x 1” square on each container to show students where to cut.
- Ask students to cut a 1” x 1” square in the side of their carton, following the marked outlines, and then tape a 1.5”x1.5” piece of plastic across the hole. (Tape the plastic on both sides, inside & outside the container.)
- Fill each milk carton with soil and plant a radish or pea seed. Be sure students place their seeds near the side with the viewing square. (If planted too far back, students will not see the roots growing.) Place near a classroom window or outside in a protected area.
- Water the plants regularly and observe them weekly after the seeds sprout. Have students discuss and record their observations once a week for four weeks.

ROOTS AND SHOOTS

AGES
8-13 years old

CONTRIBUTED BY
Full Option Science System (FOSS)
Lawrence Hall of Science, Univ. of Calif., Berkeley
Berkeley, California
www.fossweb.com and www.outdoorbiology.com

There’s more to a plant than meets the eye! Use a trowel to dig up and investigate the root structures of numerous schoolyard plants—weeds! Uncover these varied below-ground structures (roots) and find out how they support the shoots, the visible parts of the plants.

MATERIALS
• For each group of four students: one trowel and hand lens
• For the class: four marking flags, basin of water, plant with fibrous roots, plant with taproot, two opaque bags, marker, string

PREPARATION
• Find one weed (grass) with a fibrous root system. Wash roots and enclose the plant in an opaque bag so that only the roots are visible; label the bag “1”. Do the same for a plant with a taproot; label it “2”.
• Flag four different weeds growing in the schoolyard.

DIRECTIONS
• Gather students in a circle near one flagged plant. Pass around mystery plant “1” so students can closely examine the roots. Have students describe them. Point to a flagged plant and ask students to describe the shoot (the above-ground part of the plant including the stem, the branches, leaves and flowers).
• Explain that each group will carefully dig up several (two to four) different weeds (unwanted plants). Point out the four different flagged plants. Explain that students should try to find a plant that matches one of the flagged plants, dig it up and rinse the roots in a basin of water.
• Following root extraction, call students to the sharing circle and display the collected roots and shoots. Ask questions about the roots they dug up.
  - Are some roots harder to get out of the ground?
  - Were you able to get all the roots out?
  - Why is it hard to get the roots out?
  - Was anything attached to the roots?
• Focus the discussion on root types.
• Does anyone have a plant with roots like plant “1”?
• Discuss similarities and then identify them as fibrous roots. Introduce mystery plant “2”. Ask for some descriptions of this root. Give students time to look at their roots to see if any are similar. Identify this as a taproot. Ask:
  - What do roots do?
  - Which roots hold the most soil after they are out of the ground?
  - Do roots “branch” like shoots?
  - Shoots have stems, leaves, flowers and bark. Do roots have structures like these?
• Ask students to guess what the mystery plants will look like. Unveil the hidden plants. Compost the weeds and drain the dirty water onto a few plants.

Modified from the FOSS Next Generation Edition, Structures of Life Module, (Investigation 2, Growing Further, Part 3: Roots and Shoots) developed at the Lawrence Hall of Science, copyrighted by the Regents of the University of California, 2015, and distributed by Delta Education.
MORE VEGGIES FOR ME... LESS FOR THE PESTS!

AGES
8-18 years old

Kansas Association for Conservation and Environmental Education (KACEE)
Manhattan, Kansas
www.kansasgreenschools.org/green-schools-garden-gate

Insects are an integral part of every garden. In vegetable gardens, beneficial insects (bees, ladybugs, etc.) benefit the garden by pollinating plants and eating insect pests. Harmful insects (squash bugs, aphids, etc.) may cause damage to crops if left unchecked. This lesson will help to determine the difference between those insects that are deemed harmful and beneficial and experiment with ways to encourage beneficial insects and control pests.

MATERIALS
• Insect net
• Glass jars covered with holes in lid and/or mesh fabric
• Small sponge soaked in water (if overnighting insects)
• Cubed white bread
• Choose five or more pest control options: cayenne pepper, vinegar, lemon juice, garlic, marigolds boiled in water, organic insecticide, biological controls (lady bugs, etc.)
• Online field guide about insects, e.g. http://bit.ly/1XDZ7t3

PREPARATION
• Ask students what they think makes a fruit or a vegetable organic. Guide students to understanding that organic fruits and vegetables are those raised without the use of human-made or synthetic processes, like pesticides.
• Ask students to think about what some of the challenges might be in raising organic fruits and vegetables. Explain that one of the biggest challenges is managing pests that consume or destroy produce. They will test some natural pesticides to see what would be best for controlling pests in their garden. Students choose between the natural options, placing the test ingredient on a bread cube and sealing it in a jar full of insects.
• Choose a pest problem in your school garden. Describe the pest control methods available to the students for testing (lemon juice, cayenne, praying mantis, etc.).
• Take students outside to collect insects that harm the garden.

DIRECTIONS
• HYPOTHESIS: Divide students into groups, assign each group an organic pest control method. Challenge them to write a hypothesis on their own, using an “If, Then, Because” statement about how the control method might work and why.
• METHOD: Have students test their hypothesis. Instruct students to write out their methodology. This includes all the materials necessary to conduct their experiment, a control (cube of bread) and specific step by step procedures that could be followed by someone else.
• ANALYSIS: Record experiment results. Students should produce at least one chart and show how they will determine the success of their hypothesis. (e.g. number of insects on the bread, insect death, avoidance, etc).
• CONCLUSION: What did students learn about pest control?
• APPLICATION: Have students examine all the results. Ask students which method they think might work best on a larger scale in the garden? Ask students to identify their rationale for their recommendation. Apply the chosen control method to the garden and monitor results.
• FOLLOW UP: A week or two later, complete the scavenger hunt again. Has the chosen pest control method been effective?

CIVILIZATIONS OF THE AMERICAS: AZTEC ALEGRIÀ RECIPE

AGES
5-11 years old

CONTRIBUTED BY
The Edible Schoolyard
Berkeley, California
www.edibleschoolyard.org

At the Edible Schoolyard in Berkeley, our students study ancient civilizations of the Americas, combining social studies lessons with related hands-on cooking and gardening projects. The activity below is a cooking project using a grain called amaranth, which was a staple food of the Aztec Empire and was considered sacred. In addition to growing amaranth, the Aztecs followed many of the Mayan agricultural traditions like growing cacao, harvesting honey and growing food on terraced hills. In later years, the Incas further developed terraces using stone walls and rigid geometric patterns. In our curriculum, we explore those agricultural practices and ideas by trying many of them with the students.

BACKGROUND

- Amaranth has been a cultivated grain for thousands of years. The bright flowers can also be used for dying cloth and making pigment. When the Spanish conquered the Aztecs and saw how important the grain was for their culture, they banned it.

- Mayans discovered chocolate before the Aztec civilization came about. Chocolate is made from cacao beans. The beans we eat are the seeds within the cacao pod, which grow on trees in the tropics. The cacao plant is native to Mexico. There is bountiful evidence that the Mayan civilization used cacao in their everyday life and valued it highly. We show our students images of Mayan hieroglyphic writing and explain that from writings such as the Popol Vuh, we know that the Maya had two main uses of cacao: as currency and as a special drink. The Maya believed the cacao bean had magical and divine properties and they prepared it in the form of a frothy drink that only nobility could consume.

- The Maya were among the world’s first beekeepers. They cultivated honey from a native stingless bee that resides within living trees in the tropical forests of Central America. Honey was harvested as part of a religious ceremony twice a year. Honey was used as a sweetener, an antibiotic and as an ingredient in the Mayan version of mead, a fermented drink.

INGREDIENTS FOR AZTEC ALEGRIÀ

- 1/3 cup brown rice syrup (or maple syrup or honey)
- 1/2 cup sunflower seeds
- 1 teaspoon ground cinnamon
- 1 cup amaranth, from the school garden or purchased
- 1 tablespoon honey

DIRECTIONS

- Line a sheet pan with parchment paper. Place the jar of brown rice syrup into a pot of hot water. In a deep pan, pop the amaranth in small batches, setting the popped amaranth aside in a mixing bowl.

- Lightly toast the sunflower seeds in a deep pan. Add the toasted sunflower seeds and cinnamon to the popped amaranth.

- Slowly stir in the warmed brown rice syrup and honey. Mix well and pour alegria onto the sheet pan. Spread the alegria mixture evenly over the sheet pan and let it cool. Cut into two inch squares or store it in an airtight container.

- Eat together in the school garden.

Adapted from Edible Schoolyard’s, “Civilizations of the Americas” lesson by the Edible Schoolyard staff. The complete lesson can be found at: http://bit.ly/1qNkoW1
PUMPKIN MATH

AGES
5-11 years old

CONTRIBUTED BY
Lombard School District 44
Hammerschmidt Elementary, Learn + Play Gardens
Lombard, Illinois
www.whslearnandplaygardens.org

Pumpkins can be studied for their many properties including weight, circumference, number of seeds, number of ridges and whether they sink or float. Using a fall pumpkin harvest, this math lesson can be taught school-wide or within a single classroom. In a garden’s first year, growing pumpkins is a manageable project for teachers to take on without feeling pressure to have a “green thumb”. The resulting graphs provide visuals to enhance a garden bulletin board.

MATERIALS
- Pumpkins, one per group
- Scale
- Tape measure
- Large bowl or a sink filled with water
- Knife, spoon and sheet pan
- Salt and cooking oil
- Oven

DIRECTIONS
- Explain the goal of the Pumpkin Math activity to the students: to use estimation and fact checking to learn about the properties of pumpkins.
- Divide students into groups of three or four. Distribute a pumpkin to each group, or ask students to gather in one large group to discuss the properties of the pumpkin.
- Start by asking students if they think the pumpkin will sink or float. Demonstrate by setting the pumpkin in a bowl of water. Discuss what happens and why.
- Next, ask students to estimate the pumpkin’s weight, circumference, number of ridges, and the number of seeds inside the pumpkin.
- Fact check the estimates by asking the groups of students to measure and record their pumpkins’ actual weight and circumference and to count the number of ridges.
- Cut the pumpkins open and remove all the seeds. Ask the students to clean the seeds and count them using various strategies, like counting them in groups of ten. Discuss the results. Were their estimates correct? Were they over or under the actual number? Discuss.
- Ask students to graph their results. This can be done with one graph comparing all the pumpkins that were studied at the school. For example, place the number of ridges, the weight, the circumference or number of seeds along the y-axis and the various group names along the x-axis.
- Combine seeds with cooking oil and salt in a pan. Roast them in the oven and enjoy them with the students as a healthy snack.
- The colorful charts produced for the Pumpkin Math activity can be used to decorate a garden bulletin board.
A garden tea party, fun for everyone, can also be an excellent format for including some science. Our garden class incorporated tea making into the third grade classroom’s unit on States of Matter. Evaporation and condensation, changes in temperature, thermometer reading and recording skills, conducting, and insulating—these ideas can all be pulled into making a lovely pot of tea!

**MATERIALS**
- Two to four teapots (clear glass teapots are great visuals)
- Fresh herbs from the garden or purchased
- Hot water thermos or kettle
- Honey
- Spoons, one per teapot
- Cooking thermometers, one per teapot
- Clear glass or plastic cups, one per teapot
- Baskets for gathering herbs

**DIRECTIONS**
- Children gather herbs, such as mint, from the school garden. Small teams harvest and prepare the herbs, remove the stems, tear leaves in half and place them in empty teapots. Plan to steep the tea for at least 10 minutes.
- Review or introduce thermometer use and observe the current air temperature.
- Place a thermometer into each teapot, and slowly start to pour hot water. Once temperature stabilizes, a student from each group records the temperature. As tea steeps, students periodically record the change in temperature.
- Discuss what will happen when you take off the teapot’s lid, as part of a conversation about evaporation, water vapor, and the gas phase of water. Show clear cups and ask children how they could capture some of that water vapor. Give each team a cup to place on or above the teapot and watch steam condensing.
- Show honey and discuss whether students think it is a solid or liquid. Each team stirs honey into their tea and observe the process of dissolving/mixing. Pour and drink!

**EXTENSIONS**
- SCIENCE EXTENSION: After a discussion of recorded temperatures and the cooling observed, make a plan for insulation vs. conduction experiments. What materials could we try using to keep the tea as hot as possible?
- CULTURAL EXTENSION: Invite students’ families to share a favorite tea or tea drinking customs, including medicinal values for these herbs.
- BOTANY EXTENSION: Make teas out of different plant parts. For example, chamomile flowers, licorice roots, mint leaves, rooibos twigs or cinnamon bark.
- MATH EXTENSION: After tasting different teas, children record their preferences and analyze these data.

Living Classroom
Los Altos, California
www.living-classroom.org

This lesson is intended to coincide with the 4th grade Social Studies topic of California Indians. Students will learn about various plants that the Indians used for housing, baskets, food, medicine and tools. Students learn how plants were crucial to the survival of Native California Indians and can find many of the plants in their school’s own native plant garden. Students will gain hands-on experience with the plant material during this activity.

MATERIALS
• Bag of dried acorns (or gather with students)
• Tarp or terry cloths, mortar and pestle, bowls to collect shells and kernels, twenty pounding rocks

DIRECTIONS
• Quickly introduce the importance of acorns: One of the mainstays of the diet for California Indians was the acorn which was used in soup, porridge and bread from sixteen different species of oak trees. Because of the nutrition provided by acorns, the Native American people in California did not need agriculture. Acorns contributed to the fact that California peoples did not experience annual famine months. It is estimated that among one tribe, the Yokut, a typical family consumed 1,000 to 2,000 pounds of acorns each year. Acorn meal is 21% fat, 5% protein, 62% carbohydrate, and 14% water, mineral, and fiber. Show photos of acorn meal, acorn mush and acorn pancakes if you have them.

• After enough acorn meat is obtained, allow students to take turns with the mortar and pestle to pound the acorn meat into acorn meal. (30 seconds per student, so it goes quickly.)

• While the kids work, provide more information. In the fall, Indians would travel to special groves of oak trees that produced abundant crops to collect acorns. Acorns were a staple crop—something they ate on most days and it supplied a large portion of the calories in their diets.

• Acorns take time to process. It is best done over the course of a semester or several weeks.

• How to process acorns:
  - Gather them, dry them and remove the shells
  - Grind them with a mortar and pestle, then leach this flour with water to remove tannic acid (very bitter).
  - Cook the acorn meal in a basket to make mush or toast it on hot stones to make pancakes.

• If there are acorns on campus, go with students to collect them. Otherwise include acorns in your activity kit.

• Bring the acorns to the tarp and spread them out. Place the small terry cloth material on the tarp, one per student.

• Show the students how to crack the acorns. Place one acorn on a rock and then use the other rock to smash the acorn between the two rocks. Once smashed, ask students to peel off the outer layer and put the acorn meat in one bowl and the shell in another.

The nutrition provided by acorns is crucial to the survival of Native California Indians. Acorns contributed to their diet and allowed them to experience famine months. The acorn meal is rich in fat, protein, carbohydrate, and water, mineral, and fiber. Students will gain hands-on experience with acorns during this activity.
In this activity, students create edible bouquets with the guidance of a garden leader. Their bouquets may include greens, herbs, and edible flowers, and may be made as part of a garden walk or from pre-harvested materials. Students learn the names of the plants in their bouquet, as well as basic nutrition information, and how food impacts health. The bouquets may be eaten on the spot, taken home by students, or used as part of an optional cooking activity.

**MATERIALS**

- Twine or rubber bands and scissors
- Edible bouquet components: kale, Swiss chard, salad mix, herbs, pea shoots, edible flowers (nasturtiums, violets, borage, calendula, daylilies), and other favorites!

**PREPARATION**

- Begin by walking around the garden before students arrive, making a list of different plants they may be able to harvest for their bouquets. If needed, research basic nutritional information or an interesting fact about each plant you would like to include, e.g. “One cup of kale has more Vitamin C than a glass of orange juice!”

**DIRECTIONS**

- This activity works best with a small group of students—about 10-12 students per adult is a good ratio. Adults can help younger students as needed with harvesting, and at the end with tying their bouquets together.

- Gather students in a circle. Tell them they will be making bouquets, but unlike most flower bouquets, everything in their bouquet will be edible. If needed, define the words “edible” and “bouquet” with the group. Tell students they will be allowed to pick one thing at each place you visit together in the garden, but they must wait for instructions before picking.

- Lead students in a walk around the garden with 4-6 stops along the way. At each stop, introduce students to the plant they will harvest: its name, one fact about that plant, how they should harvest it, and how many pieces they may harvest. Help students collect all their materials together to form bouquet. At the end of your walk, assist students in tying their bouquets with a rubber band or piece of string.

- Review what students learned by asking them to identify the different plants in their bouquet and what they know about each one. Also encourage them to talk about the nutritional benefits of each component in their bouquet and how specific foods can impact our health (e.g. greens are great for digestion, Vitamin D is great for our bones, Vitamin K is great for our eyes).

- You may wish to allow students to eat pieces of their bouquet immediately following the activity (or taste test along the way), put bouquets aside to take home, or use the bouquets as part of a cooking activity together.

**EXTENSION**

- COOKING WITH BOUQUETS: Cooking with youth is an excellent way to make them feel connected to their food and empowered in their cooking skills. Select bouquet components that can be used as part of a recipe. After making bouquets, disassemble them and use the components to cook a recipe together.

- WEED BOUQUETS: Make a bouquet out of weeds growing in the garden! Talk about what it mean to be a “weed,” adaptations of different weeds, and how we decide if a plant is beautiful or not. (Don’t eat weeds unless edible!)
HOW MANY HONEY BEES?

AGES
5-13 years old

CONTRIBUTED BY
Slide Ranch
Muir Beach, California
www.slideranch.org

Do people need bees? Do bees need people? How many honey bees do you think live in a hive? The average number of bees in a medium sized colony is 42,000. By acting out the process of gathering nectar, students gain a larger understanding and appreciation for bees, the process of making honey, and how bees impact the food we eat.

MATERIALS
- Jars (one large, several small)
- Spoons
- Water
- Optional: yellow food coloring for water (to make it look more like nectar), markers and paper.

DIRECTIONS
- Spread out jars filled with water in an outdoor area.
- If possible, position jars near actual flowering plants, or ask students to draw flowers and then instruct the students to place the drawings under the jars. The jars can be far apart or close together depending on the space available.
- Give each student a spoon and explain that they are going to use the spoon like a bee uses its “proboscis” (straw-like tongue) to collect the nectar from the jars.
- Students will deposit the “nectar” they collected into one centrally located jar representing the hive.
- After five minutes, look to see how much “honey” is in the “hive.”
- Debrief: A bee typically makes 40 trips from the hive to flowers and back in a day. In its whole life a honey bee makes about ½ teaspoon of honey.
- Ask: How many honey bees do you think work together to make one jar of honey? How about one gallon of honey? What about all of the honey in the supermarket? How did it feel to be a bee?

Through reading a short book together and exploring the schoolyard, students will learn about the parts of a plant and what a plant needs to survive, and will create a list of questions to explore as a class.

MATERIALS
• From Seed to Plant, by Gail Gibbons, or other age-appropriate book about how plants grow
• Construction paper
• Poster paper
• Pencils, colored pencils
• Bag to carry supplies outside
• Clipboards

PREPARATION
• Walk through the garden to ensure that it is ready for your students.

DIRECTIONS
• Take your students into your schoolyard and bring the bag of supplies. Create a “KWL chart” that documents what students know (K), want to know (W), and learned (L). Start by asking students what they already know, and complete the “K” section of the chart.
• Read From Seed to Plant, or another book that describes how plants grow.
• Direct students to pick a tree or plant in their schoolyard to sketch, using colored pencils and paper. Ask students to label the parts of the plant that they can see.
• Bring the class back together at a predetermined meeting spot. Ask students to explain the different parts of the plant they observed, using their sketches.
• When you return to the classroom, continue working on the “W” section of the KWL chart by asking the students to list more questions. Over the next several days, investigate those questions with the class. As students learn new information, add to the “L” section of the chart.

EXTENSIONS
• Ask students to use construction paper to create parts of a tomato plant (roots, stem, leaves, flowers and fruit) and the different things that plants need to survive (sunlight, water, air, and nutrients).
• Create a “What Plants Need” chart, on poster paper or construction paper. As your students learn what all plants need to grow (sunlight, water, air and nutrients) add a picture of each of them to the display.

ENGINEER A
SEED GETAWAY

AGES
6-15 years old

CONTRIBUTED BY
Joan Chadde, Michigan Tech CSEO and
Susan Trull, Ottawa National Forest
Houghton, Michigan
www.wupcenter.mtu.edu

This activity engages students in learning about plant life cycles, adaptations and characteristics that contribute to survival. Students observe a variety of seeds and classify them according to their “getaway” strategy from the parent plant. Next, the activity incorporates engineering as students design a seed get-away that will allow the seed to be carried the furthest by the wind (a box fan).

MATERIALS
- Samples of plants with seeds
- Samples of seeds, ranging in size and dispersal method
- Box fan
- Seed get-away design materials—rice or lentils, tissue paper, feathers, colored paper, tape, scissors, glue sticks
- Pencils and data sheets
- Cups and water for float test, one cup per group
- Terrycloth towel for stick-to-fur test, one per group
- Marker and masking tape

DIRECTIONS
- Go outside to the school grounds and show plants that have seeds on them. Ask students to find the seeds.
- Discuss: What is a seed? Why do seeds disperse? Seeds come in many shapes and sizes and use gravity, wind, water and animals to disperse. Show examples.
- For younger audiences: Ask students to act out the life of a plant from seed to the parent plant dropping its seeds.
- Classify seeds by dispersal mechanism. Have several types of seeds ready: some that use animals (e.g. burdock, berries); some that float (e.g. crab apple); some that are windblown (e.g. milkweed, maple); some that use gravity (e.g. evening primrose or apples).
- Give each group six to ten seeds and a data sheet. Ask students to test for different properties using materials provided. Discuss results and fun facts about each plant.
- Use the engineering design process to design a seed get-away: Tell students they are to design a seed that could be wind dispersed, and should be able to fly as far as possible. They will test their designs with a fan. Students choose a seed—lentils, split peas, beans—that is light and easy to hold onto. Provide glue stick, scissors, and a variety of attachments such as tulle, tissue paper, confetti strands, shredded paper, small feathers, etc.
- Ask students to follow the engineering design process:
  - ASK: Can you design a way for the seed to get away from the parent plant?
  - IMAGINE: With a partner, write down at least three ideas for helping a seed to get away.
  - PLAN: Tell students what materials they will have to choose from today. Ask them to draw their seed get away design using these materials.
  - CREATE: Allow each group time to follow their plan and build their seed get-away mechanism.
  - TEST AND IMPROVE: Evaluate each design with the students and give them time to make changes, if needed. When most students have a design ready, start the performance test. Point the fan along an open floor with at least 12 feet clear for the seeds to fly. Ask each student to drop their seed into the air stream. Ask each student to mark the location where their seed lands with a piece of tape with their name. Give students time to make improvements to their designs and test them again.
Place-Based Understanding

Living schoolyards, built with local, natural materials and native plants, are each unique, reflecting the geography, ecology and culture of their community and building a sense of place for children and adults who spend time in them.

**NATURAL CONTEXT** Green schoolyards can showcase local ecosystems in their region, helping children to connect on a daily basis to the living systems, geology and topography that surround them.

**GEOGRAPHIC CONTEXT** Large painted or three dimensional maps of many types can be added to schoolyards to illustrate the school’s location in the world, the country, the state, the city, the neighborhood or even their watershed.

**CULTURAL CONTEXT** Many school communities have incredibly rich cultural diversity which can be celebrated in living schoolyards with art, events and activities that reflect the school’s population and context.

**HISTORICAL CONTEXT** Every school site and surrounding neighborhood has its own history, whether it is newly built or has stood for hundreds of years. Curricula about local history can be connected to the unique patch of ground managed by your school, and the results may be displayed creatively outdoors, for everyone to enjoy.

**ACTIVITIES IN THIS CHAPTER**

- **Have Seeds, Will Travel**
  Natural context / observation / art (3-10 years old)

- **Finding Your Place in the World**
  Natural context / observation (3-18 years old)

- **Schoolyard Investigations Using Tools**
  Natural context / science fieldwork (4-8 years old)

- **“Sense-sational” Tree Tour**
  Natural context / observation / trees (5-8 years old)

- **Adopt-A-Tree**
  Natural context / science / art (5-8 years old)

- **Act Like Leopold**
  Natural context / journaling (5-10 years old)

- **I Spy a... Tree! Plant! Bug!**
  Natural context / observation (5-10 years old)

- **Six of One, Half Dozen of the Other**
  Natural context / classification (7-18 years old)

- **Reflection Writing in Your Green Schoolyard**
  Natural context / observation (7-18 years old)

- **Guidebook: Native Plants in the Schoolyard**
  Natural context / schoolyard field guide (9-18 years old)

- **Decoding Midwestern Rocks and Minerals**
  Natural context / geology (10-14 years old)

- **Nature Passport**
  Geographic context / nature / writing (4-10 years old)

- **Create a Schoolyard Site Survey Map**
  Geographic context / mapping (3-18 years old)
Students will improve their observation skills while creating bracelets and bookmarks from small items they find in nature during schoolyard exploration.

**MATERIALS**
- Clear packing tape (at least 1 inch wide)
- Scissors
- Optional: hole punch and string or ribbon

**PREPARATION**
- Scout the site ahead of time to ensure there are no poisonous or harmful plants for children. If working with young children, designate safe boundaries ahead of time.

**DIRECTIONS**
- Help students to loosely wrap a strip of clear packing tape like a bracelet around their wrist, sticky-side out.
- Go on a hike around the schoolyard or a wooded area and ask students to collect small treasures from nature such as plant seeds, pieces of leaves, blades of glass, petals from flowers, etc. As students collect these items, they can attach them to the sticky surface of their tape bracelet.
- Once the bracelet is full, cover with a second piece of packing tape sticky-side down to seal the collection.
- When finished, students cut the bracelet off their wrist and flatten. Punch a hole at each end and tie with a ribbon to create an adjustable bracelet. Students can also re-purpose the bracelet by flattening and using it as a bookmark while reading interesting books about the outdoors!

**DISCUSSION**
- What did you hear, see, smell, touch while you were exploring?
- Why did you pick what you did? Are there brighter items on the bracelets? Did anyone carefully arrange the collected items? Or just stick it on there?
- How are seeds moved in nature? Discuss methods like: wind, floating on water, bouncing or rolling away from parent, eaten or stored then later dropped by animals, sticks to animal fur, or released by extreme heat.
- Why does a plant need to distribute their seeds away from the parent plant?

**EXTENSIONS**
- Learn more about seed dispersal with PLT’s Connecting Kids to Nature activity page for family and friends: http://bit.ly/1UzkCWm
This “activity” is remarkably simple yet potentially profound, and gets more valuable if it can become a regular part of a weekly or monthly routine. The power of observation relies on the conditions of settling the mind, tuning the senses and sparking curiosity. By giving each student their own space (or “place in the world”) and singular task to simply notice what is happening, students develop a practice they can bring with them anywhere they go outdoors.

MATERIALS

- No materials are necessary for this activity, however it lends itself to on-going field journaling practice (drawing and writing observations, questions, musings, etc.)

DIRECTIONS

- Identify an outdoor area that is large enough for students to have a personal sitting space at least 10 feet from other students. This can be an area that is new to them or one that they are already familiar with. (If the latter, this can be presented as a challenge for them to notice something new that they had been previously unaware of.) Ideally students will be invited to find their own sitting spot, with the understanding that this is not a talking activity.

- The initial length of time for their observations can be as short as 3-5 minutes. If this activity becomes a regular part of a weekly routine its duration can be increased in response to students’ capacities and interests. There is value in returning to the same sitting spot over time so that phenological changes can be noticed (changes in natural phenomena, e.g. the changing growth phases of a plant). Afterwards, invite students to share their insights and surprises. This discussion with an interested adult adds a vital component to their connection with the natural world.

- There are many activities teachers can do with their students to extend this activity such as:
  - Make a sound map of the area around each student
  - Engage a “See-Think-Wonder” inquiry: Focus on one thing that interests students. Encourage them to write about it and pose related questions.
  - Write a poem (haiku or cinquain)
  - Ask students to write a letter to themselves from the perspective of a plant or animal in their space
  - For older students, ask the following questions related to values in decision-making about human impacts on a place: What has happened here? What is happening here? What should happen here?

- If journaling, invite students to “dialogue journal” with a partner to share questions and observations. Alternatively, invite students to bring their journal home so their parents can engage in the dialogue with their own questions.
SCHOOLYARD INVESTIGATIONS USING TOOLS

AGES
4-8 years old

CONTRIBUTED BY
Monterey Bay Aquarium
Monterey, California
www.montereybayaquarium.org

Young children can use observation and measurement to find out more about an environment using simple tools that extend human senses and make the data collected more precise and scientific. In this activity, students take a closer look at a small part of their schoolyard and use scientific tools to observe and explore what they see!

MATERIALS
• Magnifier, thermometer, 1m-long piece of string
• Science notebook, pencil, clear tape

DIRECTIONS
• Select an area of your schoolyard that has both sunny and shady areas. Explain to students that today they are going to do what scientists do—collect data—about their schoolyard. Show them the place in their science notebooks where they will record their findings.
• Tell students to:
  - Make a string circle, lay it on the ground and observe what you find inside of it.
  - Collect a soil sample from your circle and tape it into your notebook.
  - Use the thermometer to take the surface temperature inside your circle.
  - Count the number of insects you find in your circle.

• After students spend time collecting data, return to the classroom and graph and analyze or discuss what they found. Record students’ questions on a chart or Question Wall for further investigation. Help them think about their data by asking the following questions:
  - Look at your soil samples. What do you see? Now look again with the magnifier. How are the two samples the same? How are they different? Could you find some soil that looks different from your samples? Where would you look?
  - Which area was warmer, sun or shade? Do you think we could find the very WARMEST place in our schoolyard? Where would you look? Do you think the temperature stays the same in those areas all day? How can we find out?
  - How many insects did you find? Where could you look for more? Do you think you would find the same number if you went back another day? How can we find out? Can you find a place with more insects in the schoolyard? Where might you find more insects, in the sun or in the shade?
  - What did you find in the sun that you didn’t find in the shade? What did you find in the shade that you didn’t find in the sun?
  - What interesting thing did you find? Was it in the sun or shade? What makes it interesting to you? Can you describe it?
• Scientists must look more than once at their study areas to begin to answer questions. Ideally, take the children out again to answer these and other questions.
**“SENSE-SATIONAL” TREE TOUR**

**AGES**
5-8 years old

**CONTRIBUTED BY**
Canopy
Palo Alto, California
www.canopy.org

Engaging and fun, this fresh-air tour of schoolyard trees engages students through their senses to observe trees up close and view trees in new ways. Students then use their observations to describe the similarities and differences among the trees at their school.

**MATERIALS**
- Bags for students to collect tree items
- Paper and clipboard
- Colored crayons or pencils
- Fruit from trees, to share with the class (optional)

**PREPARATION**
- Select and identify four or five trees at your school that satisfy the five senses. For example, trees with leaves of interesting shapes or colors, leaves that are fragrant, textured tree bark, or fruit trees.
- Gather samples from trees such as leaves, fruits or seeds.
- Find out a few facts about each tree to share with students.

**DIRECTIONS**
- At each tree, ask the students to explore and experience the tree with the appropriate sense(s):
  - **SIGHT**: Students stand around the tree and look up and down. What colors and shapes do they see?
  - **TOUCH**: Invite students to gently touch the tree bark and leaves. How do they feel?
  - **SMELL**: Pass around leaf samples for students to smell. How does it smell? (If there are no fragrant trees on campus, teachers can bring in samples from other trees. For example: bay, camphor, citrus.)
  - **HEARING**: Ask students to listen to the tree. What do they hear? Ask students what sounds they might hear from animals living in or around trees. If students hear human activity, talk about how people live among trees and that we are part of nature. Ask students why they think humans need trees.
  - **TASTE**: Engage students in a discussion about which foods come from trees. Bring in fruit from trees, to share, or distribute the school’s fruit snack.
- After the tour, students may share the similarities and differences among the trees they observed and discuss which tree(s) is their favorite and why.
- Ask students to draw one of the trees they observed, label the tree’s parts, and write a paragraph describing the tree and what they appreciate about the tree. Or, if students collected samples, they can create an art piece with the tree parts they collected.
ADOPT-A-TREE

AGES
5-8 years old

CONTRIBUTED BY
Naomi Hershiser, Prairie Crossing Charter School
Grayslake, Illinois
www.prairiecrossingcharterschool.org

I
ntroduce students to the study of phenology (the study of nature’s seasonal changes through the year) by adopting a class tree. Classes choose a tree that they will visit and observe throughout the year, looking for changes over time. By adding complexity in the recording tasks, this activity can be appropriate for a range of ages.

MATERIALS
- Recording tools (nature journal or paper and a clipboard, pencils or colored pencils), one per student

DIRECTIONS
- Choose a tree to adopt. The best trees are accessible to the classroom, change throughout the year, and exhibit their important phenophases (flowering, leafing out, seed formation, color change, leaf loss and dormancy) while school is in session.
- Introduce the class to the tree at the beginning of the school year as a member of the class. On the first visit to the tree, guide students to look at the tree’s different parts very carefully. Ask them to describe the leaf’s shape and color, the feel of the bark. Have them look at the tree from far away to get its overall shape, as well as close up. Look for evidence of animals interacting with the tree, such as chewed leaves, nests or spiderwebs in the branches.
- Ask students to draw the tree. Remind them that this drawing is supposed to be a realistic drawing, and they are trying to show what the tree looks like to someone who can’t see it. (Depending on student level, they can label their drawings or describe the tree in words.)
- Take a photograph of the class with the tree. This, and subsequent photos, can be displayed in the classroom or used in digital displays.
- Keep students’ tree photos on hand, so that each visit pictures can be added to the previous and create a complete picture of the tree through the seasons.
- Visit the tree every couple of weeks. In winter, when there are fewer changes, visit less frequently, but rapid change in spring and fall may merit more frequent visits.
- Start each subsequent visit by having students look for differences between this visit and last time. A review of the photos or drawings can help jog their memories.
- At each visit, ask students to draw the tree, and take a photo from the same vantage point.
- At the end of the year, review the data with the students. Ask them look at their own drawings as well as photos to determine how they’ve progressed. These also make great portfolio entries, showing students’ academic growth through the year.
- Enjoy getting to know your class tree. It can be the inspiration for art, writing and scientific inquiry.
ACT LIKE LEOPOLD

AGES
5-10 years old

CONTRIBUTED BY
Aldo Leopold Nature Center
Monona, Wisconsin
www.AldoLeopoldNatureCenter.org

Aldo Leopold was a famous naturalist and teacher. He is perhaps most well-known for his book of nature-based sketches, stories and observations, *A Sand County Almanac*. This activity encourages children to do things like Leopold. You can simply examine the natural world and record what you see and hear, or add other activities inspired by Leopold’s writing and philosophy.

MATERIALS
• Journal or notebook
• Pencils or colored pencils
• Other optional materials such as a bird call app called Identifyer (http://bit.ly/1Vx0o8c), matte frames and binoculars

PREPARATION
• Leopold loved to sit or hike in nature and record his observations. His stories often include the sounds he heard and give life to what he imagined the animals were enacting. For example, in the July chapter of *A Sand County Almanac*, he writes about rising at 3:30 am to sit outside with his dog, a pot of coffee and a notebook to record each bird he hears as the morning progresses. “At 3:35,” he writes, “the nearest field sparrow avows, in a clear tenor chant, that he holds the jack pine copse north to the riverbank, and south to the old wagon track.” He then adds robin, indigo bunting, wren, warbler and others to his list until his “ear can no longer filter out priorities.”
• As an optional preparation, you can use Identifyer or other bird app to introduce children to the local bird sounds they may hear.

DIRECTIONS
• Give each child a journal and set of pencils. Find an outdoor location where everyone can sit comfortably and spread out.
• Warm up the children’s listening skills by having them close their eyes and simply point to the sounds they hear—these may be natural or man-made sounds.
• Give students 5-10 minutes (depending on age and ability) to sit and observe whatever is happening around them. They can write about, sketch, or list what they see and hear.
• Complete this activity 2-6 times throughout the year and note how their observations change throughout the seasons. Talk about the study of Phenology.
• Compile the students’ notes and sketches into an “almanac” like Leopold’s.

EXTENSIONS
• Provide binoculars and instructions on how to use them; include tips on how to best spot birds and other wildlife.
• Provide cardboard matte frames and allow children to place them around an image or area they want to focus on. For example, they may lay it on the ground and focus on the plants and insects or, they may hold it at arm’s length to frame a scene or landscape they want to focus on.
I SPY A...
TREE! PLANT! BUG!

AGES
5-10 years old

CONTRIBUTED BY
Sandi Snyder
Big Pool, Maryland

The future of our Earth relies upon the environmental education of our students today. Incorporating environmental issues into our science programs is of utmost importance. The activity begins with an outdoor game for children that helps them to learn about the local environment, and to identify beneficial insects, plants, and trees. It can also be used as a science teaching tool and a starting point for discussions about local environmental wisdom in the community.

MATERIALS
• Gardening gloves
• Small magnifying glasses
• Small cups or receptacles with a lid for collecting bugs
• A tongue depressor or a stable stick to pick up bugs
• Cameras and/or drawing paper and writing tools
• Ask the students to take pictures, draw pictures, and/or give a detailed description of what they find.
• When they are back in the classroom, give the students additional time to research more information about the trees, plants, and insects they encountered. Through their hands-on field work and independent research, students will learn how to identify local organisms and what their roles are in the ecosystem. Hold a class discussion to share the research findings and drawings.
• The class can also discuss the impact of each of these organisms on humans. Some of the insects, trees, and plants are useful to us. Others make it more difficult to grow our agricultural crops or present other issues for our communities. Class discussion can include information about how to encourage plants, trees and insects that help us and how to discourage the ones that eat our crops or cause other problems for people.
• If there are parents in your community who work as organic farmers, invite them in to talk about beneficial insects and the other management practices they use to keep their crops healthy without chemicals.
• This activity can also be linked to a discussion of edible and medicinal plants that are found in your local area. Ask students to interview their parents or grandparents to find out if they know how to make any home remedies or special edible treats using local plants. Review the recipes students bring in (check for safety) and share them with the class.
SIX OF ONE, HALF DOZEN OF THE OTHER

AGES
7-18 years old

CONTRIBUTED BY
Life Lab
Santa Cruz, California
www.lifelab.org

In this activity, groups of students will search for objects in the garden that have a specific quality and those that have the opposite quality. Students use multiple senses to find and classify contrasting objects in the natural environment.

MATERIALS
- One egg carton per group of three students

PREPARATION
- On the bottom of each egg carton write two words. One should be a likely quality of a garden object, such as “wet”. The other should be its opposite (“dry”). Use words that will encourage students to use their senses, such as dark/light, rough/smooth, dull/colorful, scented/unscented, scratchy/soft, etc. Label each carton with different opposites. To discourage unsupervised tasting, avoid opposites that refer to taste.

DIRECTIONS
- Divide the class into groups of three. Tell the class that each group will get a special collecting container in which to collect 12 items. They shouldn’t let any other group see the secret information on the bottom of the carton.
- Distribute the cartons and demonstrate to each group how the opposites should be placed, with six of each category in a long row. On the bottom of the carton are secret words that tell what category of objects to collect. Every group will be collecting different opposites.
- Remind students to handle everything gently and to take only small specimens. Allow enough time for students to explore the site and gather the items they need.
- When the groups are finished, have them each exchange cartons and try to determine which opposite categories the other group collected, without looking on the bottom of their carton.
- Discuss strategies that the groups used for identifying the other group’s classifications.
REFLECTION
WRITING IN YOUR GREEN SCHOOLYARD

AGES
7-18 years old

CONTRIBUTED BY
Nature’s Voices, Green Schools Initiative
Berkeley, California
www.naturesvoices.org

This activity links to the Language Arts Common Core Standards by asking students to reflect upon why green schoolyards are important to their school. Students choose their favorite spot in the schoolyard, then use a prompt to write about the benefits of green schoolyards for themselves and their school. These essays can be published on the Nature’s Voices website and on other community platforms to showcase student stories about green schoolyards.

MATERIALS
- Pen, paper and clipboard for each student
- Computer access to publish the stories on the Nature’s Voices website, listed above.

DIRECTIONS
• Tell the class that May is Living Schoolyard Month and that they will be brainstorming, writing about and then publishing stories about the many reasons why their green schoolyard is so important to them.
• Begin by taking students on a tour of the schoolyard, stopping at all of the students’ favorite spots and reflecting on why these places are special. The teacher can designate a note-taker to record comments during the walk.
• Gather the class and lead a discussion to reflect on the site tour. The discussion might include questions like this:
  - Name some of your favorite places on the school grounds and tell us why they are so special to you?
  - What are some of the benefits of green schoolyards? Students might say: nature calms them down; they love that their school is protecting the environment; or they have fun playing in nature at school.
  - How does the green schoolyard help the community? Ideas might include that the school is saving water, growing food or planting trees.
  - Should other schools have green schoolyards like the one at your school? If so, why?
  - Are there other elements that students would like their schoolyard to include, to make it even greener?
• Teachers continue the lesson by giving each student a clipboard to write an essay that summarizes what they were thinking about during the discussion. Students choose their favorite place in the schoolyard, sit down there and write for 15-20 minutes. The general writing prompt might be: “Why I love my green schoolyard” or “What my green schoolyard means to me.”
• After students have completed the first draft of their essays outside, the teacher can later use them to teach or practice the writing process by creating edited revisions. Students may also illustrate their writing with photographs or drawings.
• With their teachers’ assistance, students can publish their completed stories and images on the Nature’s Voices website. This website, listed above, is a storybank of written work, photographs and videos from and about youth, who share their thoughts related to their environmental and outdoor experiences.
• Students and teachers can also brainstorm other ways to share their stories, from publishing their essays in the school or community newspaper to sharing them on the school’s website.
This activity produces a schoolyard habitat guidebook that is specific to your own school site, and is useful for students and visitors. Working on the guidebook—and selecting native plants for the habitat or studying those already there—helps students feel a sense of ownership for habitat plants on your grounds. This is also a great way to integrate technology use with hands-on, outdoor studies.

**MATERIALS**
- Access to computers and the Internet
- A list of native plants in your locality or a list of the plants that are already in your school ground habitat
- A template for a final presentation (e.g. slides or written)

**DIRECTIONS**
- Ask the students to select a native plant whose name they like or randomly distribute names of local plants. Give students both the common and the Latin name.
- Students can work individually or in groups depending on the number of plants you’d like them to research. Ask students to conduct some research online or in the library to find out more about their plant. Students should gather: a description of their plant, including size and identifying characteristics; the plant’s needs for survival; a list of wildlife this plant will attract; human uses for the plant; and other fun facts. Ask the student to also look for pictures of their plant during each of the seasons.
- If the class will be choosing plants for your school ground habitat, ask the students to recommend whether or not the plant they researched should be placed in the habitat. (Some may need more or less sunlight, or may be too big or too small for the intended space.)
- Ask the students to give oral presentations to a panel of plant experts or to a small group. Laminate the presentation materials for each plant that will be placed or exists in your school ground habitat, to create a new guidebook to your native garden.

**EXTENSION**
- Ask the students to:
  - write a blog post about their plant and its attributes
  - take a video of themselves talking about their plant and share it online
  - make a QR code to post near their plant in the garden, and link it to their video or research narrative
  - design garden signs for their plant
  - talk with local plant experts about their plant research

**PLANT WEBSITES FOR STUDENTS:**
- USDA www.plants.usda.gov
- eNature www.enature.org
- LBJ Wildflower Center www.wildflower.org
Students love rocks! Ask each student to bring in a sample, or collect a bucket full for students in the class to choose from. In this activity, students will use the same methods a geologist uses—the characteristics of minerals, such as cleavage, luster, hardness and weathering—to identify the rocks they have found. Note: There will almost always be a sample that does not key out easily! If you end up with a ‘mystery rock’ encourage students to search online or reach out to local geologists—every state has them, usually working for your Department of Natural Resources.

MATERIALS
- Variety of rocks and minerals, at least one per group
- Steel nail
- Diluted Hydrochloric Acid (HCL, found at pool supply stores) or vinegar
- Paper towels

DIRECTIONS
- Use this dichotomous key and the scientific method to figure out which rock or mineral you have.
- 1. Scratch your rock with the steel nail. (You may have to scratch very hard and more than once!)
  - If your rock is easily scratched by the nail or it leaves a groove in the rock ...................... go to 2
  - If your rock is not easily scratched by the nail, but the nail leaves a silver mark like a pencil ...... go to 6
- 2. Scratch your rock with your fingernail.
  - If your rock is easily scratched or broken by your fingernail, is black and lightweight, your rock is.. COAL
  - If your rock is not scratched by your fingernail..go to 3
- 3. If your rock is wet, dry with a paper towel. Put a small drop of HCL (or vinegar) on your rock and observe.
  - If your rock fizzes or bubbles ....................... go to 4
  - If your rock does not fizz or bubble ............ go to 5
- 4. Look closely at your rock.
  - If your rock is yellowish, white or clear and has a square shape your rock is the mineral ...... CALCITE
  - If your rock does not look square and is grey or tan your rock is ......................... LIMESTONE
- 5. Look closely at your rock and touch its surface.
  - If your rock is white, reddish-brown, golden-brown, feels sandy and rough like sand paper your rock is .......................................................... SANDSTONE
  - If your rock is grey, black or brown with some shiny green or blue, your rock is what is left over after burning coal ............................................ CINDER
  - If your rock is white or clear, may have sharp or rounded points, and sometimes looks like cauliflower or stacked pencils you have a mineral called...........QUARTZ

ADDITIONAL RESOURCES
NATURE PASSPORT

AGES
4-10 years old

CONTRIBUTED BY
Nature Net
Madison, Wisconsin
www.naturenet.org

Nature Net is known for its summer activity booklet, *Nature Passport*, which encourages learning and exploration throughout the summer at each of the Nature Net member sites in south central Wisconsin. In this activity, students create their own passport and travel itinerary around their own schoolyard. How many destinations can they traverse and learn about? This activity will encourage students to look for nature everywhere they go.

MATERIALS

- Journal, notebook or design your own passport booklet (leave space on each page for journal entries)
- Stamp pad and stamps

PREPARATION

- Survey your school grounds for various areas that differ from one another. Examples might include woods, short grass, tall grass, shady and sunny areas, blacktop, playground, vegetable garden, hilly and flat areas, busy or quiet zones. You can map these out or simply plan in your mind where you would like to visit, and which locations would be best for observing natural phenomena.

DIRECTIONS

- Give each child a passport journal and a writing utensil.
- Discuss with students how travel takes us to new lands and gives us a new perspective on the world around us. Encourage children to think about and examine the places they visit as if they’ve never been there before. What new things might they see? What kinds of nature may exist? What might they see if they are quiet or if they look closely?
- Visit each site as a class, encouraging students to explore, listen, get down low, use their sense of smell, or quietly observe. Ask students to take notes in their passports about what they see in each new place: different types of plants, animals, scenery, sights and sounds. Their notes can be in the form of drawings or writing.
- Ask students to think about what they would put in a postcard to their families or friends back “home” to best describe their travels.
- Stamp their passports to signify they’ve visited each site.
- The class might visit several locations in one day or throughout the year. Note (or make predictions about) how places change through the seasons. Which animals do you see or not see? What textures and smells are different? Does the wind move or sound distinct in each season or location?

EXTENSIONS

- Add photos or other keepsakes to your passport. Consider setting up a class photo album, Instagram, or Sift account to record your memories and “travels”.
- Use the same passport for field trips off site as well. Send it home at the end of the year as a reminder of all the travel adventures around the school and “abroad”.
- Send students home with a Nature Net *Nature Passport* at the end of the year to encourage them to continue their exploration. Contact Nature Net to order a classroom set.
CREATE A
SCHOOLYARD SITE
SURVEY MAP

AGES
5-18 years old

CONTRIBUTED BY
U.S. Fish & Wildlife Service
Sacramento, California
www.fws.gov/cno/conservation/schoolyard.cfm

A schoolyard site survey takes students on a journey around the campus to identify areas used by people, both formally and informally, physical features of the campus, and human-related and biological characteristics of the site.

MATERIALS
- U.S. Fish & Wildlife Service’s Schoolyard Habitat Project Guide, see: http://1.usa.gov/1RZLep0
- All available maps and images of the school
- Camera
- Measuring tape
- Field guides
- Binoculars
- Pencils, markers and graph paper

DIRECTIONS
- Draw an outline of the school property, school buildings and parking lots. This is your base map.
- Walk the entire schoolyard.
- Sketch on your base map all of the important physical, human related and biological characteristics listed below. Create a legend and designate symbols to mark important characteristics.
- Create a collective schoolyard site survey that includes observations from the whole class about the following features:
  - TOPOGRAPHY: Identify high and low spots. Locate steep slopes.
  - PREVAILING WIND: Indicate prevailing wind direction.
  - SUNNY AND SHADY AREAS: Distinguish between areas that receive full sun, partial shade and full shade.
  - WATER: Designate any areas that are obvious drainage or waterways. Indicate direction of water runoff. Locate any areas where erosion is occurring. Locate spots that seem especially wet or dry.
  - STRUCTURES: Identify structures where students play or gather such as playground equipment, bike racks, signs, benches, picnic tables and fences.
  - FIELDS: Identify the athletic fields and areas that are used for informal play either by the school or other members of the community. Identify where students gather for fire drills.
  - ACCESSIBILITY: Identify areas that are accessible during a class period. Indicate formal and informal pathways. Identify spaces used by the public.
  - UTILITY FEATURES: Locate obvious utility lines above or below ground. Locate existing water or irrigation lines and accessible spigots.
  - PLANTS: Locate and identify trees, shrubs and plants that provide food and cover for wildlife, both on and adjacent to the school grounds.
  - WILDLIFE: Locate and identify signs of wildlife on the school grounds.
  - GROUNDCOVER: Indicate different groundcovers such as grass, bare earth, pavement, woodland groundcovers, native plantings or garden areas.
- Discuss your observations and completed schoolyard map with the class and with the rest of the school.
Wildlife and Habitat

Schoolyard wildlife and native habitat zones are important and engaging places that help students of all ages connect to the natural world. They illustrate that “the environment” is not just a far away place—it is something that surrounds us all in our local neighborhoods. Wildlife sanctuaries and schoolyard ecosystems, large or small, enrich school curricula while providing refuges for a variety of species. They allow students to see that wildlife can exist in urban and suburban areas and even thrive with a little help. Wildlife areas and native plantings can be connected to the curriculum in countless ways, including nature observation in science classes, sketching practice in art classes, and population estimates/counts for math classes.

The strongest wildlife projects on school grounds provide well-rounded habitats that fulfill the basic needs of local wildlife: consistent food sources, clean water, shelter and areas where they can rear their offspring. Successful schoolyard wildlife sanctuaries also provide places for students to observe birds, animals and insects while leaving the creatures relatively undisturbed. They are peaceful havens for quiet reflection where flora and fauna are nurtured, changes happen slowly following ecological cycles and planting schemes highlight seasonal change and mimic natural patterns.¹

ACTIVITIES IN THIS CHAPTER

- Garden-Based Learning: Interdependence  98
  Ecosystems / adaptations (7-10 years old)
- Schoolyard Habitat Survey  99
  Schoolyard biodiversity / assessment (5-10 years old)
- Documenting Biodiversity in Your Schoolyard  100
  Schoolyard biodiversity / assessment (9-18 years old)
- Passive Quadrat Sampling  101
  Schoolyard biodiversity / assessment (16-18 years old)
- Throw and Grow  102
  Plants / prairie habitat propagation (9-13 years old)
- Mean, Median, Mode—Oh My!  103
  Plants / forest ecosystem / math (10-15 years old)
- Butterfly Habitat Hunt  104
  Insects / schoolyard ecology (5-12 years old)
- Insect Biodiversity in the Prairie  105
  Insects / prairie habitat (6-13 years old)
- Insects: Good, Bad or Both?  106
  Insects / identification (8-18 years old)
- Pour a Pond: Wetland Insect Exploration  107
  Insects / aquatic diversity (8-18 years old)
- Springtime Math with Worms  108
  Worms / counting (3-5 years old)
  Birds / science lesson (4-8 years old)
- Citizen Science: Project Squirrel  110
  Squirrels / science fieldwork (9-13 years old)
- Blue Whale: An Animal of Unusual Size  111
  Ocean ecosystem / math (10-18 years old)
- Least Wanted: The Invasive Sea Lamprey  112
  Lake ecosystem / science game (11-18 years old)
GARDEN-BASED LEARNING: INTERDEPENDENCE

AGES
7-10 years old

CONTRIBUTED BY
Berkeley Public School Gardening & Cooking Program
Berkeley, California
www.berkeleyschools.net/cgp

Students explore different environments within the school garden to identify various ways flora and fauna adapt to natural and non-natural environments. After this lesson, students will understand how plants and animals survive in their habitats and will have an emerging understanding of biodiversity and its importance in gardens of all types.

MATERIALS
- Garden journals and pencils
- Assorted garden tools
- Scavenger hunt cards that picture flora and fauna found in your school garden (make these ahead of time with your class)

DIRECTIONS
- Bring the class outside into your school garden.
- Distribute garden journals and scavenger hunt cards to teams of two. Discuss how plants have particular features that enable them to conserve water and absorb sunlight.
- Instruct students to find a plant to describe that: has tiny leaves, a spine, uses stems to climb, is covered in tiny hairs or has giant leaves. Have them find an animal or insect that: burrows under ground, sunbathes, eats garbage or walks on two feet. Students document these findings in pairs as they explore the garden using their scavenger hunt cards.
- Regroup students and discuss adaptation behaviors and physical features that help living things survive in their habitat. Students then share their observations and discuss how these characteristics could have adapted over time to fit their environment.
- Ask students to discuss with their partner their knowledge of what plants and animals need to survive (nutrients, sunlight, water, shelter). Next, encourage the partner pairs to share their discussion with the group. Students can describe what they found during the scavenger hunt and share something about how it has adapted to its environment.
- To provide ceremony to the closing of the lesson, offer students a seasonal snack or invite them to forage and taste something in the garden on their way out. Ask students to think about how that piece of fruit or vegetable has adapted to survive in its environment.
SCHOOLYARD HABITAT SURVEY

AGES
5-10 years old

CONTRIBUTED BY
CalRecycle
Sacramento, California
www.californiaeei.org

Students conduct a survey of their schoolyard to determine in what ways it is a habitat for plants and animals. They work in small groups to discuss and sketch their ideas on how to improve their schoolyard for plants and animals.

MATERIALS
- Piece of paper (and clipboards if feasible) for students to record their findings (written words or drawings) while they are outside studying schoolyard habitats.

DIRECTIONS
- Put students in pairs. Assign each pair an adult helper/older student buddy, if available.
- Explain to students that they are going out to the schoolyard to see which plants and animals they can find. They will use their paper to draw and write about some of the plants and animals they see and will note where they found them.
- Lead them outside, talk about appropriate physical boundaries and the importance of not disturbing what they see (nests, flowers, etc.). Give them 15 minutes to walk around the schoolyard recording what they find.
- Return to the classroom for a group discussion about the findings. Teachers may help the class organize and summarize their findings in columns, e.g. “What We Found” (animal or plant) and “Where We Found Them”.
- Finish the activity by having students write and draw about how people can help plants and animals survive in their habitats. Doing so will help teachers assess students’ understanding. (e.g. We can plant trees to make a habitat for birds.)

Using simple tools and technology, develop and carry out an original scientific investigation about biodiversity on your school campus. Use iNaturalist to conduct a biological survey, get help with species identification and connect with a global network of naturalists. Then, analyze your data, draw conclusions and share your findings to inspire environmental stewardship in your community.

MATERIALS

- Mobile device with iNaturalist app downloaded, one per group of two to five students
- Science notebook, one per student

PREPARATION

- Setup login: http://bit.ly/1RZMRmB
- Select your schoolyard study site as your “place”

DIRECTIONS

- Lead a short discussion accessing prior knowledge about schoolyard biodiversity. Ask the students: Which species (large or small) have you seen on your school grounds?
- Show students the iNaturalist website and app and, if applicable, show any data that already exist near your schoolyard. Ask students: Which of these species are unfamiliar to you? Who collected these data?
- Explain that today students will be collecting data using iNaturalist to document the species they can find in their schoolyard.
- Ask students to log onto iNaturalist on the mobile devices. Model how to take a photo of an individual organism and sync to iNaturalist. Give students time to practice.
- Ask students to create a preliminary inventory by using a mobile device to take photos of individual organisms.

Divide responsibilities so that everyone has a chance to take photos, sync to iNaturalist, identify species and complete online entries. (Use the online tutorials to practice this process before teaching the students.)

- Facilitate a discussion about what the students observed. Ask: What kinds of organisms did you observe? What did you see that you didn’t expect?
- After students have a sense of local biodiversity, have them work in small groups to examine the data, compare their schoolyard to a nature preserve and discuss.
- Then ask students to answer questions in their science notebooks: What kinds of organisms are abundant near your school? What is rare? Why do you think that is? How did the organisms near your school get to be there? What do they need to survive? Does anything seem strange, confusing or interesting to you about what lives in your environment? Record all questions in science notebooks.

RECOMMENDED EXTENSION

- Continue students’ background research on local environmental issues by investigating local news and interviewing community members. Ask students to develop their own research questions, gather more data on the schoolyard, analyze results and share them with their community.
- More information is available from: http://bit.ly/1Tag0dA
PASSIVE QUADRAT SAMPLING

AGES
16-18 years old

CONTRIBUTED BY
Eisenhower High School
Goddard, Kansas
ehs.goddardusd.com

Quadrat sampling is a classic tool for the study of ecology, especially biodiversity. In general, a series of squares (quadrats) of a set size are placed in a habitat of interest and the species within those quadrants are identified and recorded.

MATERIALS
- Squares (1 meter square) made from PVC pipe pieces and corner angles
- Site map (Google Earth aerials are useful to draw on)
- Camera
- Clipboards and pencils

BACKGROUND
- Passive quadrat sampling, done without removing the organisms found within a given quadrant, can be done by hand, with students carefully sorting through each individual quadrat or by photographing the quadrant for future analysis. Abundances of organisms found at the study site can be calculated using the number found per quadrant and the size of the quadrat area. This information can provide the school with a data set to track annual changes.

DIRECTIONS
- Each group of students chooses an unpaved location to study, either in a natural or maintained outdoor area. A variety of locations may spur conversations about differences found. Each group has their own set of materials to conduct the quadrat sampling procedure.
- Students prepare a site map of the physical features of the area. Students use a consistent set of symbols to represent the organisms on site. For example, green triangles represent trees, blue circles represent insects.
- Toss a quadrat into the grass. Students survey the area within the quadrat and take a photo of the quadrat area.
- Students draw symbols on the map to show the location and relative abundance of each type of organism.
- On a separate sheet of paper, students record any observations or organisms in their environment, and describe the physical characteristics of their study area:
  - SUNLIGHT EXPOSURE: Full sun, partial sun or full shade?
  - SOIL: Is the soil sandy, silt, clay or organic matter?
  - RAIN: When was the last rainfall recorded?
  - MAINTENANCE: Is this area maintained?
  - WATER DRAINAGE: Is the area well drained?
  - VEGETATION COVER: How much of the soil is covered with vegetation? How much soil is exposed?
- Students use their hand lens to inspect the area, and record the insects they see, while being careful not to disturb the soil and the organisms that live in it.

ANALYSIS: Return to the classroom and ask the students to display their maps. Students calculate the estimated population of a species for the sample area, using $T = NA$:

- $T = \text{total population estimate}$
- $N = \frac{\text{total number of individuals counted}}{\text{number of quadrants}}$
- $A = \frac{\text{total area}}{\text{area of quadrat}}$

CONCLUSIONS: What are the differences between the areas that each group in the class studied? Are there any differences from previous year(s) results? What have the results revealed about the local ecosystem?
**THROW AND GROW**

**AGES**
9-13 years old

**CONTRIBUTED BY**
Mississippi National River and Recreation Area
St. Paul and Minneapolis, Minnesota
www.nps.gov/miss

Students will discuss how prairie ecosystems benefit lakes, rivers, and wildlife. Instructors should customize this program for their specific region. Students should be able to list two characteristics of prairies and two ways prairies benefit rivers. In brief, the long roots of prairies stabilizes soil, decreases rain runoff, and recharges groundwater. After learning about prairies, students will make seed bombs, small balls of soil, compost, and prairie seed for distribution on school grounds or other location.

**MATERIALS**
- Two bags of top soil, .75 cu ft size (do not use soil with additives such as fertilizer, peat, vermiculite, etc.)
- 8 cups of mushroom compost
- 8 cups of playground sand
- Native prairie seeds, a mix of grasses and flowers
- 18-20 ounce bowls, one per student
- Ten heavy weight plastic soup spoons
- Four plastic cups (9 ounce size)
- Prairie root presentation and props

**DIRECTIONS**
- This activity can begin to address processes and systems, relationships between humans and the environment, and constructing a product or system that addresses a problem.
- Discuss characteristics and benefits of prairies, ideally using local examples. Compare prairie plant root length with that of turf grass.
- Discuss how to make the seed bombs (also called mud marbles, seed balls, etc.) and where they should be distributed.
  - In a bowl combine one cup of soil, three rounded spoonfuls of compost, three mounded spoonfuls of sand, three pinches of native seeds, and four spoonfuls of water. Mix them all together.
  - Take a small amount of this mixture; enough to make a 1 inch ball. Squeeze it fifteen times. The mixture will begin to form a play-doh like consistency around squeeze number twelve. Do not make the balls too big or they won’t break apart in the rain.
  - Let the balls dry for two or three days and then store them in a cool, dark, dry space.
- Distribute the seed balls at planting sites in late winter or early spring to allow for the seed bombs to be outside in freezing temperatures for approximately four weeks.
- Alternately, store the seeds in the freezer for four weeks, and then make seed bombs.

**MINN. DEPT. OF NATURAL RESOURCES**
Prairie benefits information: http://bit.ly/1UKTpej
Minnesota historical prairie map: http://bit.ly/1PURBe7
MEAN, MEDIAN, MODE — OH MY!

AGES
10-15 years old

CONTRIBUTED BY
LEAF - Wisconsin’s K-12 Forestry Education Program
Stevens Point, Wisconsin
www.leafprogram.org

In this activity, students will measure the circumference of tree trunks to determine mean, median, mode and range values for a group of trees. Students will work in small groups.

MATERIALS
• For each group of students: clipboard, paper, calculator, pen or pencil and a flexible tape measure (or string to fit around tree trunk and match circumference to ruler)

DIRECTIONS
• Introduce the concepts of mean, median, mode, range and circumference to students before going outside.
• Go outside to an area with at least five trees.
• Ask students to form small groups.
• Each group should measure the circumference of five trees and record each tree’s circumference in a table the students create on a blank piece of paper.
• After all of the trees have been measured, ask students to calculate the mean, median, mode and range of the trees’ circumference.
• Ask students to graph their results. If your site has multiple trees of different species, go more in depth with the following steps.
• Encourage the students to collect the circumference measurements from multiple trees of the same species and enter them into a table. (One species per table; record at least two species.)
• After the tables have been filled out, students should calculate the mean, median, mode and range for each species and graph the results.
• Ask each group to compare the data and results by having them write about the following:
  - Describe the similarities among the tree species that were measured.
  - Describe the differences among the tree species that were measured.
  - Compare just the circumference measurements taken from the trees in one species. Were the measurements all the same? Ask students to explain and analyze their results.
• Discuss with the class why different trees may have different size trunks based on the data collected. Include a discussion of the age of the tree, light and water requirements, growing conditions and species growth patterns.
Students will explore what butterflies need in order to survive and will investigate their own school grounds for butterfly habitat.

**MATERIALS**
- Pictures of local butterflies
- Research/articles on butterfly habitat and host plants for your geographic area
- Magnifying glasses
- Nature journals

**DIRECTIONS**
- Explore the concept of wildlife habitat with your students. Ask them what they think wildlife need in order to survive.

- In order for an animal to survive, it must be able to find adequate habitat that provides food, water, cover and a safe place to raise young. The amount and quality of these needs varies a great deal from species to species.

- Now have students think specifically about butterflies. Where do they tend to see butterflies? What do they think butterflies eat? Where do they think butterflies find cover and raise their young?

- Many butterflies require specific plants in order to survive. These plants are called “Host Plants.” For example, Monarch butterflies require milkweed in order to survive. Ask students to research which butterflies are present in their local community and which habitat and host plants they may require.

- Next, take your students outside to your own schoolyard and have them explore the grounds for butterflies and plants. Younger students can draw what they see in their journals or you can also cut out squares of construction paper of different colors. Hand out one or more (depending on level of students) squares of several different colors and have them look for butterflies or flowers that include that color. Ask students to observe these animals/plants carefully and draw them in their journals. For older students, take them outside for a butterfly/plant hunt. As a group, search for the butterflies and plants they identified in their research.

- Alternatively, divide students into groups and ask each group to look for one specific type of butterfly or plant. Depending on the time of year, students can also look for butterflies and draw what they see in a nature journal or on a sheet of paper.

- When you return to the classroom, examine your results. Make a list (or simple sketches) of the plants and/or butterflies you found. Could you add any plants to make the schoolyard a better place for butterflies?

> Consider planting or starting a butterfly garden as part of a Schoolyard Habitats® site. Visit our website for more information: http://bit.ly/1ScGx7H
INSECT BIODIVERSITY IN THE PRAIRIE

AGES
6-13 years old

CONTRIBUTED BY
Naomi Hershiser, Prairie Crossing Charter School
Grayslake, Illinois
www.prairiecrossingcharterschool.org

Students explore the biodiversity of the prairie ecosystem through studying its creepy crawly inhabitants. Students use sweep nets to catch insects and other arthropods from the prairie, and study them up close using bug viewers. Depending on age and curriculum goals, classes can use this activity as a way to learn about life cycles, animal classification, biodiversity, adaptations, food chains, or interrelationships.

MATERIALS
• Insect field guides and insect sweep nets (student-made or purchased), one per group
• White bedsheets and magnifying boxes
• Pencils, colored pencils, nature journals or clipboards

PREPARATION
• Insect sweeping works best in a prairie, since the presence of many trees would hinder net movement and monocultures don’t yield sufficient biodiversity. Spread a white sheet to serve as the insect-viewing area. When finished, release all specimens, unharmed, to their natural habitat!

DIRECTIONS
• Demonstrate how to use a sweep net. Swing the net in a figure-eight in front of you as you walk through the prairie grasses. The net should skim the plants but not destroy them. After several sweeps, grab the top of the net like a sac and walk back to the sheet.
• Empty the net by placing the opening on the sheet. Shake the fabric so that specimens fall onto the sheet. When you lift the net, bees/wasps should fly away.
• Explain how to catch the insects gently, and that they will be returned to the prairie at the end of the lesson. Carefully place specimens in insect viewing boxes.
• Ask students to collect their own specimens using the sweep nets in groups of two or three.

• Have students choose which insects to draw and describe with scientific accuracy. Ask students to look up their chosen insects in field guides.
• This activity can have different foci:
  - BIODIVERSITY: Compare a prairie sweep with a lawn sweep. Count the number of species and individuals in each location and discuss the differences and implications.
  - ANIMAL CLASSIFICATION: Sort the critters found into insect and non-insect groupings. Discuss the characteristics used to scientifically classify species and define some of the categories the class found.
  - LIFE CYCLE: Look for examples of metamorphosis phases in the specimens. Show the class pictures of butterfly, dragonfly and other insect life cycles to illustrate the concept. Have the class put pictures in order.
  - ADAPTATIONS: Review “adaptation” definition. Have students identify adaptations of different critters they caught and describe how these features help the animal survive.
  - FOOD: Have students place the critters they caught into a food chain or web. Ask them to draw and label their food chain.
INSECTS: GOOD, BAD OR BOTH?

Manhattan, Kansas
www.kansasgreenschools.org/green-schools-garden-gate

Insects are an integral part of every garden. In vegetable gardens, beneficial insects (bees, ladybugs, etc.) help the garden by pollinating plants and eating pests. Harmful insects (squash bugs, aphids, etc.) may cause damage to crops if left unchecked. As in any balanced ecosystem, beneficial insects can assist in pest management and keep harmful insects in check. This activity will guide students on an exploration of insects in the garden.

MATERIALS
• Clipboards and paper
• Dry erase markers for each group of students
• Journals or paper and pencils for recording observations
• Insect net

PREPARATION
• Using an online field guide such as eNature (http://bit.ly/1XDZ7t3) create a scavenger hunt sheet of insects your students are likely to find in your schoolyard or garden. Print this two-sided with beneficial insects on one side and harmful insects on the other. (These may be laminated and re-used.)

DIRECTIONS
• Take students to the garden location for the insect scavenger hunt! For each insect a student sees, the group recorder will place a tally mark next to the picture of that insect. Remind students that there are insects on both sides of the sheet. Encourage the students to observe and take notes about each insect’s behavior and sketch it if time/interest allows. If a student sees an insect that is not listed on the insect scavenger hunt sheet, these notes and sketches can be used for later identification.

• Ask students to analyze their findings: What observations can you make about the number and types of insects you found in your scavenger hunt? Which insects did we find most frequently? Why do you think this is? Which insects do you think are beneficial to the garden? Why? Which insects might be harmful to the garden? Why? What might this tell us about the health of our garden? What do you think we could do to improve the health of our garden?

• Discuss ways we can encourage the beneficial insects to stay and live in our garden. (e.g. by providing habitat, planting nectar source flowers or larval food sources, water sources for puddling, etc.).

• In what ways can we decrease the number of harmful insects? What do you think the trade off might be for each of these strategies? There are a number of ways we can control the harmful insects in our garden. We need to discover the best way to meet our needs.

This lesson will allow the students to discover the tremendous diversity of aquatic life right near their school, become familiar with the organisms in the water, learn the life cycles of unfamiliar aquatic life and learn how these animals are adapted for aquatic life.

MATERIALS
• 2-gallon buckets, one per group of three to four students
• Homemade collection net, one per group (This can be a simple kitchen strainer tied to a mop handle or a window screen on two dowels, if you don’t have a net.)
• Hula hoops, one per group of three to four students
• One roll of white plastic (or plastic table cloth)
• White spoons, magnifying glasses, white ice cube trays
• Identification resources for:
  - Macroinvertebrates http://bit.ly/1kP3iIV
  - Pond Life http://amzn.to/20poajS
  - Pond Watch Bug Dial http://bit.ly/1PmfGqA
• Optional: Hip boots or youth waders

BACKGROUND
• Wetlands support a greater variety and number of organisms than any other ecosystems. Most elementary students have very limited knowledge of the organisms found in lakes and ponds. This “pour a pond” activity provides a unique way for students to discover and study aquatic life in the classroom and in the field. In the Midwest, spring (March through May) is the best time to study the aquatic environment, but it is possible to collect and study wetland organisms at any time of the year.

DIRECTIONS
• COLLECTION: Each group of three to four students is given a bucket and a collection net. Place a few inches of clean pond in each bucket prior to collecting living samples. Show the students how to use the sampling gear. Macroinvertebrates can be found on the pond floor in leaves and detritus or with floating or emergent vegetation. Sweeping the scoops near and against these will dislodge the organisms. Students use spoons or their fingers to transfer the animals into the clean water from their collection scoop. (All of the true bugs have piercing mouth-parts so handle carefully and don’t grab them by the head.) Students can pick up sticks, small logs and rocks along the water’s edge to look for creatures.
• TEACHING PROCEDURE: Place one hula hoop per group on a flat piece of ground, or picnic table, and cover with the plastic table cloth. Pour the collection buckets into these to view the macroinvertebrates. This is the stage where students can explore the pond creatures and use the ID keys, spoons and ice cube trays to separate and identify the organisms. They can use the magnifying glasses for a closer look. Ask the students to rotate to other “ponds” to see what others caught.
• CLEAN UP AND RELEASE: It’s a little tricky to pick up the pond. Carefully lift the edges of the plastic sheet (all four corners and four sides) and gather them into a bag with the pond water at the bottom. You can carry this back to the water’s edge to release or you can empty the water gently into a bucket to release later.
• EXTENSIONS: You can keep the macroinvertebrates in an oxygenated aquarium for a couple of weeks, further study. Many students enjoy seeing the pond creatures for an extended period of time. During this time the students may be able to observe life cycle changes in some of the organisms. In addition, it will become clear which organisms are predators and which are prey.
SPRINGTIME MATH WITH WORMS

AGES
3-5 years old

CONTRIBUTED BY
Rachel A. Larimore Consulting
Midland, Michigan
www.rachel-larimore.com

Spring evokes images of tulips, bursting tree buds, frogs calling, puddles, and…worms! For many young children worms are a dream come true. They wiggle and squirm, and they have just enough slime to be fascinatingly gross. Young children’s interest in worms is a great opportunity to extend play to include math exploration and learning. Of course, worms are fun in other seasons too, so don’t just limit this activity to spring!

MATERIALS
• Buckets or other containers for collecting worms
• Small hand trowels
• Dry erase board and markers
• Rulers and measuring tapes
• Balance or scale
• Stop watch or timer (optional)

BACKGROUND
• Developmentally appropriate teaching in early childhood includes two broad categories—providing a rich physical environment and teacher-child interactions that extend and scaffold children’s learning. With that in mind, this activity description provides ideas about materials to give the children and how to use those materials to encourage rich conversations between children and teachers.
• First and foremost, the fun of worms is finding and collecting them. Buckets and other containers provide a safe place for the worms so they won’t get squished in little hands. Plus, buckets hold more—which is fun!

DIRECTIONS
• Bring the children to an unpaved, vegetated part of your school grounds, or a public space in your neighborhood. Begin the activity by asking questions like, “Where might we find some worms?” Encourage the children to search out large numbers of worms and start to identify patterns of where the worms are located. They may use their hands or small trowels to gently move a small amount of soil and leaf litter to find the worms.
• As they’re collecting worms, encourage the children to count them. “How many worms do you have?” or “How many more worms do you have, than I have?” Some children will choose to count as they are collecting. Others may choose to count by peering into the top of their bucket, or might pour them all out on the ground to count. All of these are great options! For children who are enjoying keeping track of their collection, you can provide a dry erase board and markers for recording their progress. This not only supports math, but also emergent writing skills.
• Once the children have gathered their collection, encourage them to measure some of the worms. Ask, “Which ones are longest? Shortest? Which ones are thicker or thinner?” The math lesson can then be extended by using a balance to weigh the worms.
• The activity leaders can also capitalize on children’s interest in worms by using them as part of a small group activity. One possibility is worm races! Draw a large circle or square with a stick on a smooth patch of open soil, and place the worms in the middle. The edges of the shape serve as the “finish line.” Engage the children with questions like, “Which worm do you think will finish first? Why do you think that?” Then prepare for fun, enthusiastic, and loud cheering as the children root for their worm to cross the finish line. If desired, the group can also measure the time it takes the worms to get to the “finish line” using a stop watch or other timer.
WHAT MAKES A BIRD A BIRD?

AGES
4-8 years old

CONTRIBUTED BY
Central Valley Joint Venture
Sacramento, California
www.centralvalleyjointventure.org

Through observations of birds, bird stories, images and teacher-led discussions, students will learn about the features, adaptation and traits of birds. Students will then draw pictures and text to create a booklet that helps them answer the question: What makes a bird a bird?

MATERIALS
- Children’s story about birds. Some suggested books include: That Chickadee Feeling by Frank Glew, What Makes a Bird a Bird? by May Garelick, or It Could Still be a Bird by Allan Fowler
- White paper (tabloid or legal size preferred)
- Clipboard
- Crayons or colored pencils

OPTIONAL MATERIALS
- Ability to observe wild birds; binoculars for older children would be useful
- Printed images of birds, including pictures of key concepts / vocabulary listed below
- Stuffed life-like toy birds or puppets
- Bird feathers (clean feathers, obtained at a craft store)
- Hard boiled chicken egg
- Any other props useful to describe the concepts and vocabulary outlined below

DIRECTIONS
- In an outdoor environment, the teacher will read aloud an introductory children’s story about birds. The teacher will then lead a brief discussion to find out what the students know about birds. Following the discussion, the teacher will use some of the available learning aides to discuss the key characteristics of birds. Students should be given the opportunity to observe wild birds if possible.

• Concepts / vocabulary to introduce includes:
  - BEAK / BILL: All birds have a beak or bill, but so do some mammals like the duck-billed platypus.
  - WINGS: All birds have wings but some mammals do as well like bats.
  - FLIGHT: Most birds fly but not all birds fly, for example penguins. Some mammals, such as bats can fly, too.
  - EGG: All birds lay eggs, but so do some other animals including reptiles.
  - NEST: Most birds build nests but so do some other animals including insects (wasps) and some reptiles (turtles).
  - FEATHERS: Only birds have feathers! This along with the features above makes a bird a bird!

• Students will then create a booklet of their own by folding one or more pieces of paper in half depending on how many pages are desired. On each page the students should use colored pencils or crayons to draw and describe some of the things that they learned that make a bird a bird. The clipboard is used to support the paper while the students are drawing and writing.
CITIZEN SCIENCE: CONTRIBUTING DATA TO PROJECT SQUIRREL

AGES

9-13 years old

CONTRIBUTED BY

The Chicago Academy of Sciences
Peggy Notebaert Nature Museum
Chicago, Illinois
www.naturemuseum.org/education

Be a citizen scientist and help Project Squirrel track squirrels in your community, and look for patterns across the country. Observe the characteristics of your local environment and focus on how squirrels interact with the environment around them. Identify fox and gray squirrels and record information about the amount, types and location of squirrels to help Project Squirrel researchers learn what squirrels tell us about our neighborhoods.

MATERIALS

- Mobile device with the Project Squirrel app installed
- Science notebook

PREPARATION

- Review the Project Squirrel website and download the app at http://bit.ly/PrjSquirrel

DIRECTIONS

- Show students images of fox squirrels and gray squirrels. Lead students in a discussion about the differences they notice. Show students the video on Project Squirrel’s homepage.
- Ask students what they could learn when observing squirrels and what kind of information they would need to gather.
- Prompt students to think about why scientists are asking citizens to observe squirrels in their neighborhoods. Answers may include: scientists want a larger selection of data from a greater area; squirrels are easy to see and observe; squirrels act as indicators of local ecology because they live in small territories and are active year-round.
- Preview the Project Squirrel app with students and discuss the questions they will be asked.

• Ask students to observe and record:
  - Time, date, and location of their observations
  - Number of individuals of each squirrel species
  - Types of trees located in the area
  - The food source for any observed foraging behavior
  - The types of predators that they see
  - Other observations

• Ask students to photograph and submit pictures of the squirrels. What behaviors do they see from the squirrel?
• Discuss with students: What do the squirrels need in their habitat? What about your schoolyard is beneficial or dangerous for squirrels? Why is it important for citizens to track data? What are the benefits of more data?

EXTENSIONS

• Ask students to do a longitudinal study of looking at squirrels throughout the seasons.
• Ask students to do similar studies to compare observations in different schoolyards or share information with a school in a different city.
• Participate in another citizen science project such as Monarch Watch (http://bit.ly/MonarchW) or ebird (http://bit.ly/eBird12).
• Investigate squirrel foraging behavior to calculate and compare Giving Up Densities (GUDs) in different locations: http://bit.ly/1TCSnfS

Reference: Written by Sarah Anderson, Holly Katz, Shannon Phillips, Michelle Rabkin
Blue whales are the largest animals known to have lived on earth, and they can be seen right off the coast of California! Could a blue whale fit in your schoolyard? Compare the height of a tree in your schoolyard to the length of a blue whale.

**MATERIALS**

- A yard stick and a 100 foot rope or measuring tape
- Clinometer made with a protractor, a straw, string, paper clip or metal washer

**DIRECTIONS**

- How can you tell if a blue whale could fit in your schoolyard? Start by asking students what they know about blue whales. There are many options for learning about these whales, and you can have students do research ahead of time or share information from the resource links included at the end of this activity.

- Come prepared with a piece of rope that has been pre-measured to 100 feet (or 30 meters), or a long measuring tape. Have two students each take one end of the rope and walk slowly apart until the rope is taut, then place it on the ground. Explain that a blue whale can grow to this size. Have students line up along the rope with their arms outstretched, fingertips just touching. Are they as big as the whale? Have students close their eyes and imagine an animal as big as a blue whale, swimming next to them. What do they think it is like to be a creature that size?

- Older students can compare the length of a blue whale to the height of the tallest tree on their school grounds (or to a flag pole, their school building, or other tall feature). How tall do the students think the tree is? One method to calculate the height is to compare shadows on a sunny day. Use measuring tape to measure the shadow cast by the tree. Next measure a shadow cast by a yard stick (or meter stick) held perpendicular to the ground. The shadows will be proportional to the original objects.

- Another method to calculate height is to use a clinometer. Tape a straw or a small roll of paper to the flat side of a protractor. Thread some string through the hole in the protractor (near the center of the straw), and tie a weight (a paperclip or a washer) to the string so it stretches past the bottom of the protractor and swings freely. Have one student look through the straw to see the top of the tree. Have the student move farther from or closer to the tree until a partner tells them that the string is hanging down at a 45 degree angle on the protractor. The student has now formed an isosceles right triangle with the tree (see diagram above). The distance from the student to the tree, plus the student’s height, equals the height of the tree. Is the tree taller than a blue whale is long? Imagine a blue whale next to the tree. How many trees would it take to equal the length of the blue whale? Why might it be useful to measure a tree this way?

**USE RATIOS TO CALCULATE TREE HEIGHT**

\[
\frac{\text{Shadow of measuring stick}}{\text{Shadow tree}} = \frac{\text{Length of measuring stick}}{\text{Height of tree}}
\]

\[\text{Height of tree} = \frac{\text{(Length of measuring stick)} \times \text{(Shadow of tree)}}{\text{(Shadow of stick)}}\]

LEAST WANTED: THE INVASIVE SEA LAMPREY

AGES
11-18 years old

CONTRIBUTED BY
Michigan Department of Natural Resources
Lansing, Michigan
www.michigan.gov/nature programs

This activity will engage students in an active simulation of the relationship between native lake trout, the invasive sea lamprey, and introduced non-native Chinook Salmon. This activity illustrates the importance of the early warning and detection of invasive species as they attempt to establish themselves in an ecosystem. It is a demonstration of a professional biologist’s management of an invasive species before and after its establishment, and conveys the understanding that once an invasive population is established it remains indefinitely.

MATERIALS
• Fifty name tags total, labeled as:
  - “invasive species”, one per student
  - “biological control”, one per student
  - “first invasive species”, just one
  - “habitat biologist”, up to three
• Chart paper and markers
• Cones for playing field boundaries

DIRECTIONS
• Ask participants how they think the sea lamprey got into the Great Lakes and spread. Discuss.

• Tell the students they are going to simulate a sea lamprey entering a local native ecosystem (represented by a 50 yard square playing field), and the impact it has over five years.

• One student will be the “first invasive” sea lamprey. The rest of the students represent native species. Ask all the students, both the first invasive and natives, to spread out in the playing field which represents Lake Huron.

• Chart “Year #1” using a bar graph, with one invasive and the total of the remaining participants as native fish.

• The goal of the “first invasive” student is to tag as many native fish as possible. The natives try not to get tagged. Tagged students must freeze, standing straight with arms at their side.

• Stop after 30 seconds, or less if necessary, so that not all natives are tagged. Ask all natives that are frozen to raise their hands. Hand an invasive name tag to anyone who has their hand up. They have all been overtaken by the invasive sea lamprey. Chart results as “Year #2”.

• Repeat for another 30 second period, with all new sea lamprey able to tag the remaining native fish. Chart results as “Year #3”.

• Ask the class what they could do to stop or reverse the impact the invasive sea lamprey has had on The Great Lakes ecosystem. What can stop or slow the spread of invasives including the sea lamprey?

• Introduce a “habitat biologist” (a student from the native or invasive population). That student can administer the “biological control” that has been scientifically determined to work.

• The “habitat biologist” tags “invasives” and hands them a “biological control” label. Once a student has been given a “biological control” name tag they are safe from being tagged by any “invasive” students.

• For “Year #4”, run a 30 second round and chart the results with the “invasives” and “habitat biologist” both tagging species. Did adding a biologist slow the spread of the invasive species? For “Year #5” add a second biologist and chart results.

• Lead student discussion about the chart results.
Watershed Stewardship

Clean, fresh water is a precious resource. It comes to our schools and communities in the form of rainfall and through municipal plumbing systems and natural waterways. It leaves school grounds through man-made storm drains and sewer networks, and by flowing over the landscape, percolating into the soil, and running through local creeks. In most cases, water from these sources is relatively clean when it arrives on school grounds and dirtier when it leaves. School communities have the power to improve their local water systems and to use them as educational resources at the same time by incorporating water planning into the design and use of school grounds.1

STORMWATER MANAGEMENT Schoolyards designed to manage stormwater can be beautiful and educational while holding and utilizing rainwater, and purifying urban runoff.

WATER CONSERVATION Living schoolyards can conserve water by finding and fixing leaks, incorporating drought tolerant plant species, building gardens with efficient irrigation systems, and deeply mulching planted areas.

WATER QUALITY MONITORING Well designed green schoolyards can improve the purity of local water bodies by removing particulates, nutrients and pollutants from stormwater flows. Students can conduct citizen science studies to check the water quality of ponds and rivers in their community.

GREYWATER REUSE Schools can capture lightly used water from the building, purify it and use it to water trees, reducing the amount of fresh water needed from the municipal system.

CURRICULUM The fascinating physical properties of water can be studied in hands-on science and art lessons that present unique opportunities to be outside when it rains and snows.

  Page 123
In this activity, you will map where rainwater flows around your schoolyard, observing where it collects and moves faster and where it slows down and soaks into the ground. You will also learn about where stormwater goes after leaving the school.

**MATERIALS**

- Schoolyard plan (map) or aerial photo
- Map of your neighborhood
- Pens and/or pencils

**DIRECTIONS**

- Follow the streams of water flowing during a storm to find the storm drains and catch basins and mark them on your schoolyard map with a square. These drains lead to a broader network of city storm drains, which may flow directly to a creek, river, lake or other water body.

- Check your neighborhood map to see if you can identify where the water goes after leaving your school site. If that water flows to a stream, can you trace the stream downhill to see which larger water body it joins?

- Mark the puddles and soggy spots on your schoolyard map. Where are the biggest or deepest ones? Which ones evaporate and disappear first? Can you find any “swales” (ditches)? If so, observe how planted swales slow the rainwater and allow it to be filtered and partially absorbed before the remainder flows to the storm drain.

- Can you identify any opportunities at your school to protect water quality by reducing stormwater runoff and/or preventing stormwater pollution? Stormwater pollution occurs when rain or snowmelt flows over streets or paving and picks up trash, oil, dirt and other materials as it travels. These pollutants are then carried to the storm drains and then to local creeks and streams.

- Ask your city if they have a water quality “stenciling” program to mark your local storm drains with an educational message that will help to improve water quality and habitat downstream.

RAIN is the ultimate source of fresh water. Rainwater runs off roofs, terraces, streets and yards into low lying areas draining into creeks, rivers, lakes, and oceans. Much of this rainwater can be stored and used, offsetting the need for tap water and reducing water pollution during storms. Rainwater harvesting collects runoff from roofs and built surfaces, directing water into barrels, tanks, wells or cisterns. This “stormwater” can be used for things like irrigation—everything but drinking!

MATERIALS
- 1 x 3 foot flat pieces of various materials, e.g. plywood, cardboard, metal or plastic (three or more types)
- 18 inch object (or stack of objects) to prop up flat pieces
- Gallon pitchers
- Stopwatches
- Collected rainwater (or tap water)
- Clipboards, pens, paper

DIRECTIONS
- Rainwater that runs over impermeable surfaces collects minerals and delivers it directly to the water body. Rainwater that is absorbed into soil is filtered by soil horizons before reaching the water table below. Rainwater management requires storing or filtering water on site so that it re-enters the water cycle cleanly.
- Introduce the concept of stormwater runoff: Which surfaces shed rainwater the fastest? What environmental impact can this have? (e.g. Streets collect pollution from cars, and rain can wash this into a local water body.)
- Make a chart to measure the time it takes for water to flow from the top edge to bottom edge of each surface.
- Head outside and set up the flat materials side by side on an incline using the 18 inch prop (about a 30° incline).
- Each student group is assigned one surface type, and one student has a stopwatch, one has a pitcher of water and one charts results.
- Document the time it takes the water to flow from top to bottom. Catch and measure (or just measure) the water that runs off. If resources are limited, one at a time is OK.
- Repeat four more times for each surface. Add dirt, leaves or plastic to the surfaces and observe what happens.
- Discuss results and compare surface types. Which surface is most similar to roofs, asphalt or concrete (built structures)? Which surface absorbs water? What are the benefits of absorbing water during a flood?
- Discuss ways to absorb more water on campus, like rain barrels, rain gardens, cisterns, tall plants, trees, etc.
- Look around your campus to see where rainwater might be captured. Perhaps a downspout could be redirected to fill a rain barrel or irrigate a garden. Discuss different ways to use collected rainwater.
- To calculate the amount of water your school could harvest in a month, just from roofs, you’ll need:
  - Roof area (sq feet): Google Maps’ Earth view has a scale in the bottom right hand corner to help measure.
  - Roof runoff (cubic feet/month) = (roof area) x (average feet of rainfall in one month)
**FOLLOW THE DROP**

**AGES**

9-18 years old

**CONTRIBUTED BY**

Earth Partnership  
University of Wisconsin-Madison Arboretum  
Madison, Wisconsin  
www.arboretum.wisc.edu/learn/eps

This activity introduces the concepts of watersheds and stormwater management. Students observe and collect information about water runoff on their school grounds or in the community. Using observational and critical thinking skills, students learn about the nature of water in the landscape, how to calculate the volume of rainwater runoff and ways to reduce stormwater impacts.

**MATERIALS**

- Map of your schoolyard showing the location of buildings, driveways, north arrow and scale  
- Clipboards and pencils or colored pencils

**BACKGROUND**

- Water moving over the landscape in a large city or small schoolyard after a rain will flow across the surface like a sheet, collect in channels, drain into pipes, puddle or soak into the ground. In undeveloped areas, most rain soaks into the ground, and only a small amount flows away. In built areas, land is covered by surfaces that shed water quickly, like roofs, sidewalks, roads and parking lots. This is called runoff or stormwater.

- In conventional stormwater management, untreated water goes into drains that flow into nearby water bodies. This contributes to soil erosion and sediment loads, increases water pollution and can cause flooding. If we want clean water and a healthy watershed, each site requires thoughtful stormwater management. One of the best ways to ensure clean water is to control where precipitation first comes into contact with the land. Examples of good stormwater practices include building rain gardens to collect and infiltrate water, using rain barrels to collect water for future use, using native plantings in the landscape and replacing impervious surfaces with permeable pavement.

**DIRECTIONS**

- IDENTIFY WATER PATTERNS: Teachers lead teams of students outside to identify patterns of water movement. Students locate features on their map including impervious (hard) surfaces and porous (absorbent) surfaces, and high and low points. Draw arrows to show the direction of water movement and the way the water is moving (e.g. in sheets or in channels). Locate places where the water puddles. Find the downspouts, storm drains and where water exits the property.

- CALCULATE RUNOFF: Select an area to study and measure its square footage. Using the “Follow the Drop” field sheet and average rainfall data, calculate the amount of runoff generated in your chosen area. Possible areas to measure include roofs, parking lots, sports fields, playgrounds, gardens and natural areas. You may also consider measuring pervious areas compared to impervious areas. If your base map is drawn to scale, these measurements may be made using rulers or a grid system. Use measuring tapes or paces to make on-the-ground measurements outdoors.

- DISCUSS OBSERVATIONS AND RESULTS: As a group, share your findings based on observations and data generated. Brainstorm ways to reduce runoff and increase infiltration. Identify likely spaces to create rain gardens and other stormwater best practices.

CALCULATE RAINWATER RUNOFF

AGES
10-18 years old

CONTRIBUTED BY
Education Outside with
San Francisco Public Utilities Commission
San Francisco, California
www.educationoutside.org with www.sfwater.org

In this activity, students in dry climates determine how many gallons of rainwater fall on a roof linked to their cistern. They also estimate how much water their school uses to irrigate a drought tolerant garden and determine how many cisterns they would need to meet this demand. Students will learn that a lot of water can be captured from roofs for irrigation.

MATERIALS
• Length of string or rope for measuring (50 or 100 ft)
• Measuring tape
• Rainfall chart for your area

BACKGROUND
• The average annual rainfall in California’s San Francisco Bay Area is about 20 inches (1.7 feet). This means that if it rains on a hard, impermeable surface like a roof or pavement, and there are no drains to remove the water, there would be 1.7 feet of water covering that area over the course of the rainy season. In many cities, rainwater flows from storm drains to the sewer system and is treated before it is released into the ocean. In non-urban areas, where much of the ground is permeable, rainwater is absorbed, recharges groundwater aquifers or flows into rivers that empty into the ocean.

• Rainwater can be captured and used to irrigate school gardens or to flush toilets at school. Cisterns are large containers that can hold rainwater that flows off a school’s roof. Cisterns come in many sizes and may be able to collect enough water to irrigate a school garden during dry periods, reducing tap water use.

DIRECTIONS
• Begin by visiting a cistern in your schoolyard or envisioning where you would like to put one in the future.

• To determine the area of the roof that drains to the cistern, roughly measure the building’s length and width (on the ground) using pre-measured lengths of string or using a very long tape measure. Then multiply the length and width to estimate the roof area. Area = Length x Width

- Example: If your building measures 100 ft long by 30 ft wide, then: 100 ft x 30 ft = 3,000 ft²

• Calculate the volume of runoff generated by rainfall in one year by multiplying the roof area by the annual rainfall.
  - Area of Roof (ft²) x Depth of Annual Rainfall (ft.) = Volume of Water (ft³)

• Once you have estimated the annual volume of water that falls on the roof, convert cubic feet into gallons by multiplying the volume of water (ft³) by 7.5.
  - ______ Cubic feet x 7.5 = ______ Gallons

• Discuss: How many gallons of rainwater fall on your roof annually? Can your cistern hold it all? Where does overflow go? How can you use the water you capture? How many gallons of rainwater does the school garden need? How many cisterns do you need to meet this demand?

- Determine the area of garden space that needs irrigation
- Determine the size/capacity of your current cistern

• Gardens planted with natives and drought tolerant plants use less water than most other gardens. To calculate the annual water need, assume a native plant garden needs 1,000 gallons of water per 100 ft² and use this formula:

  - (Area of Garden / 100 ft²) x 1,000 Gallons = _________ Gallons Needed Annually for Irrigation

• To find out how many cisterns you need to store this much water, divide your school’s water need (calculated in the previous step) by the capacity of your cistern.

  - Example: 200,000 Gallons (annual need) / 1000 Gallon Cistern = 200 cisterns!
  - Does this surprise you?

MANY San Francisco Bay Area native plant species are adapted to extended periods of time with little rainfall, due to California’s dry summer climate. These drought tolerant plants contrast greatly with the thirsty, non-native lawns that make up much of our built environment, including school grounds. Sheet mulching is an easy, hands-on approach to converting a lawn into a healthy layer of soil ready for planting California native species and creating a diverse schoolyard ecosystem.

**MATERIALS**
- Biodegradable “sheet” material, such as cardboard
- Mature compost
- Coarse mulch materials (wood chips or tree trimmings)
- One bucket per student; access to water
- Gardening gloves and sunglasses to protect hands and eyes from splinters and dust
- 4 inch starts of California native plants, as desired (If you live outside California, use plants that are native to your own region.)

**DIRECTIONS**
- Identify and measure the space (lawn or bare soil) you want to sheet mulch and make sure you have enough material to create one layer of cardboard, a 1 inch layer of compost and a 2 inch layer of mulch. A handy sheet mulching calculator can be found at: http://bit.ly/1Vwi7g2
- If the space is surrounded by a sidewalk, work with students to dig shallow trenches (8 inches wide x 6 inches deep) along the hardscape perimeter to prevent sheet mulching materials from overflowing onto the sidewalk.
- Sheet mulching is accomplished one step at a time:
  - Lay cardboard directly on top of the lawn (or bare soil), overlapping different pieces by at least 8 inches.
  - Wet the cardboard until it is completely saturated.
  - Add a 1 inch layer of compost on top of wet cardboard.
  - Add a 2 inch layer of mulch on top of compost.
  - Pull back the layer of mulch to plant 4 inch starts directly into the compost, as desired. Carefully place the mulch back around the starts.
  - Protect the new sheet mulched, planted zone from foot traffic until the plants are well established.
  - Enjoy the garden!
SCHOOL OUTDOOR WATER USE AUDIT

AGES
9-18 years old

CONTRIBUTED BY
Sacramento City Unified School District
Sacramento, California
www.scusd.edu/project-green-programs

Water plays a critical role in our school operations every day. In order to reduce our water usage a complete understanding of a school’s water use is needed to identify potential water efficiency opportunities. This outdoor water use audit will allow students to explore some the many areas of water use outside the classroom and guide discussion toward water saving actions and opportunities at their school.

MATERIALS
- Notebook or paper
- Pencil
- Camera (optional)

PREPARATION
- Coordinate with the necessary building staff to have someone available who can turn on your school’s sprinkler system and locate your water meter so your students can view it and make observations.

DIRECTIONS
- Begin by locating your school’s water meter(s). Discuss how the water meter measures the amount of water being supplied to your school.
- Ask the students to draw a picture of the meter or take a photo and record the number on the meter and the time. Pay special attention to the units that the meter uses—gallons, cubic feet, and hundred cubic feet are common units for water meters.
- Next, locate the irrigation controls for your school and turn on the sprinklers for all areas.
- Discuss with your students how the irrigation system is controlled and how often the sprinklers are used and why.
- Locate each of the different irrigated areas on your school property and assign a group of students to each area. (e.g. athletic fields, schoolyard, garden, ornamental landscape, etc.)
- Ask the students to make the following observations of their assigned area:
  - Describe your area in detail, including types of plants: e.g. grass, bushes, native plants, garden. What hard surfaces surround your area or are a part of this zone?
  - How does the water flow after it hits the surface? Does it run off or is it absorbed into the ground? Do you see any puddles or standing water resulting from irrigation runoff? If yes, describe the location and what you see. Take photographs or make a sketch of the area.
  - Do you see any of the sprinkler heads broken, leaking and/or gushing water? If yes, describe the location and what you see. Take photographs or make a sketch of the area.
  - Do you see any sprinklers that are over-spraying onto sidewalks, concrete and/or asphalt? If yes, describe the location and what you see. Take photographs or make a sketch of the area.
- Once finished with observations, visit the water meter again and record the number on the meter and the time.
- Return to the classroom to discuss each group’s findings including their water meter recordings on the amount of water that was used during the time it took to complete this activity.
- Follow up discussion topics can include: drought, water efficiency, surface runoff, permeability and evaporation.
Falling snow is a great way to explore the relationship between the freezing temperature and the physical phases of water. Use snow on the ground to explore temperature, melting, sublimation, runoff and water quality. Permeable surfaces filter water and allow it to infiltrate to groundwater, although frozen ground drastically slows infiltration. Impermeable surfaces might give dirty runoff a quick path to a lake, stream, or wetland—either directly or through a storm sewer.

**MATERIALS**
- Coffee mug with white interior
- Pour-through coffee funnel
- Coffee filter
- ½ cup water mixed with 1 tablespoon of sand
- Water cycle chart (see link below)
- Yardstick and/or snow gauge; or make your own with a wooden garden stake and a permanent marker

**DIRECTIONS**
- In the classroom, show students how “dirty water” goes through a coffee filter by preparing a simple demonstration. Let each student see a mixture of sandy water before pouring, sand caught in the filter and cleaner water in the mug. Water goes through the filter because it is permeable, like unfrozen ground. Water doesn’t go through the mug because it is impermeable, like a parking lot or roof.

- Outside, choose where to measure snow depth. It’s best to measure it away from snow removal operations, fences, walls, or other obstacles that might affect your measurements. If you plan to use a snow gauge, place it before the ground freezes. Young people love piling up snow next to the gauge, so they can surprise an adult with the “sudden increase” in snow. Keep a yardstick handy as a backup measuring device.

- Ask students to observe falling snow. Explore its relationship to temperature: Is it only snow or mixed with rain? What does that mean for air temperature here and in the clouds? Where does snow pile up first? What do you notice about pavement, sidewalks, and roofs? Is this different if the ground is already frozen or if it’s only recently been cold?

- Students can chart snow depth over time. Older students can also track air temperature and graph it with snow depth to understand more about melting and sublimation.

- When you have snow accumulation, explore the water cycle. Where in the water cycle is snow on the ground? What needs to happen for that solid water to go somewhere? Discuss melting and sublimation. When snow does melt, will it run off to a permeable surface?

- Ask: What happens to snow that’s been shoveled or plowed into a pile? Is the ground underneath permeable or impermeable? What is in that pile besides snow (sand, dirt, trash, etc.) that we don’t want in our water? How does that relate to the coffee mug demo? Where should we pile our snow to help protect our watersheds?

**ADDITIONAL RESOURCES**
- USGS: Water Cycle for Schools: [http://on.doi.gov/1ePVVqm](http://on.doi.gov/1ePVVqm)
Winter presents many mysteries to explore above and below the blanket of white snow. Plants, animals and humans, too, depend on snow-pack for survival. The word “subnivian” refers to the space in and under the snow-pack. The objective of *Subnivian Explorations* is to investigate the wonders of snow from multiple perspectives—including the perspective of wildlife, plants, winter recreation, snow and ourselves.

**MATERIALS**

- 4 snow shovels for the class to share
- 1 per student for each of the following items: tongue depressor, metric ruler, black laminated 3”x3” card, 3” wide paint brush, hand lens or jewelers loop (tied with bright string or flagging to help find when dropped), drawing journals and pencils

**DIRECTIONS**

- When the weather is cold and fresh snow has fallen, walk to an appropriate location for digging a snow pit. A snow pit is a method used to study the snow-pack, or the subnivian environment.

- Discuss student observations of the snow pack around them. How does it sound and feel? Is it all the same? What are some differences? What causes these differences? How might these differences affect wildlife? How might they affect people? How could we more closely investigate the snow pack?

- Demonstrate how to dig a vertical pit into the snow-pack. Ask students to take turns digging a trench long enough for all students to line up in. If space is limited, make the pit’s wall long enough for half of the students and the others can stand behind, or take turns. To dig the pit:
  - make the vertical wall north facing
  - throw the snow to the sides
  - avoid touching the walls
  - make a clean, flat vertical face to observe snow

- To study the pit, ask students to:
  - brush the face of the pit wall lightly with a paintbrush to help distinguish layers
  - feel for different layers by ‘cutting’ through layers (from top to bottom) with tongue depressors
  - reach group consensus on the locations of layers; mark them with tongue depressors inserted horizontally
  - measure and record the height of each layer (from the ground up) and the total depth of snow-pack
  - test the hardness of the layers by gently pushing fists with even pressure into the different layers. Describe the relative hardness and softness of the layers.
  - in each layer, collect a sample of snow crystals on a black laminated card; observe with a magnifying lens
  - make a detailed sketch of two different crystals

- Discuss observations. Why are there layers in the snow? With the group, draw a snow profile (graph) illustrating the different layers and depths. What weather patterns may have caused the layers they see and feel? What layer(s) would make good snowballs and which felt like large grains of unconsolidated “sugar”? How do these layers affect snow stability? How might these snow conditions affect wildlife and plants, human winter travel, and recreation? What causes snow crystals to transform in the snow pack?

**FOR MORE INFORMATION ABOUT SNOW:**

http://www.fsavalanche.org/snowpit
http://winterwildlands.org/snowschool/
Energy and Climate

School facilities use a substantial amount of energy for heat, light and power, and many school community members use fossil fuels to commute to school. Schools can engage students in reducing their facility’s energy footprint (and saving money), while teaching real-world lessons about where energy comes from and what it takes to produce and transmit power. Students can also be encouraged to walk and bike to school to reduce fossil fuel use.¹

RENEWABLE ENERGY School grounds can host renewable energy demonstration systems that power decorative fountains—or the entire school—teaching children and their communities about clean and sustainable sources of energy.

CLIMATE IMPROVEMENT School ground design can address climate change and make the site more comfortable by removing pavement, rubber and plastic, which heat up in the sun, and by planting trees and shrubs to provide shade for students and school buildings.² Students can engage in citizen science projects to analyze their school ground microclimates and look for ways to cool the hot spots they find.

CURRICULUM CONNECTIONS Living schoolyards with energy and climate features that are accessible to students provide hands-on learning resources for science and other curricula. Art activities can also be tied to an understanding of the sun’s power to provide heat and light. Curriculum lessons can also be tied to seasonal change and highlight the natural variations or adaptations needed by people and animals during different times of the year.

ACTIVITIES IN THIS CHAPTER
- Math in the Real World: Angles of the Sun
  Renewable energy / solar / math (9-10 years old) 126
- Introduction to Renewable Energy
  Renewable energy / science (9-11 years old) 127
- How Cool is Your Schoolyard?
  Climate improvement / fieldwork (8-18 years old) 128
- Fabric Sun Prints
  Curriculum / art project using sunlight (6-18 years old) 129
- Make a Solar Etching
  Curriculum / art project using sunlight (8-18 years old) 130
- Diminishing Returns
  Curriculum / energy / science (10-14 years old) 131

OTHER RELATED ACTIVITIES
- Painting the Seasons
  Curriculum / nature-inspired art (2-12 years old) 19
- Outdoor Survival
  Curriculum / cold weather skills (10-18 years old) 55
- Build a Hoop House
  Climate adaptation / stewardship (8-12 years old) 147
In this lesson, students will apply the use of angles to a real-world problem—finding the angle of the sun to determine the placement of solar panels. This activity can be used to teach about angles or to reinforce and apply an understanding of angles.

MATERIALS
- 1 white board or chart paper and drawing materials, for the teacher
- Protractors, 1 per pair or team of students
- Journals and pencils for each student

DIRECTIONS
- ENGAGE: Ask the class to describe what they know about solar power, and where they think solar panels should be placed on the school grounds.

- Discuss that people need to know the angles of the sun to solve real-world problems for things like solar panel placement. Explain that they will now find the angle of the sun relative to locations around the school building to determine the ideal placement for solar panels.

- EXPLORE: Ask the students to explore their schoolyard or outdoor classroom in pairs or teams and to imagine the apparent movement of the sun across the sky during the day.

- Allow students to determine the best way to find the sun’s angle before offering support. At this point, it’s okay for them to have misconceptions. Those can be corrected later.

- Move from group to group asking guiding questions that lead the students to use the ground as their starting point line (like the bottom of their protractor). If more support is needed, the leader can help model how to sketch the current angle of the sun. Place yourself at the center of the protractor’s base, and match its arc to the sun’s path across the sky. Try to ask questions that allow the students to figure out how to use their protractors to measure the angle themselves.

- EXPLAIN: Ask students to convene to share their findings with one another. Some students may have found different results depending on which directional orientation they started with. See if the students can figure out why their numbers are different.

- Ensure that students understand that the sun is directly overhead in the middle of the day (a right angle).

- Explain that the sun rises in the east and moves through the acute angles in the morning, passes the right angle around noon, and moves through the obtuse angles in the afternoon and evening.

- Ask students to illustrate an obtuse angle that they might observe from the sun’s position in the afternoon.

- ELABORATE: Ask students to work independently to identify times of the day when the solar panels in their chosen location would experience shade.

- Ask students to sketch the angles which will produce shade, measure them, and label them. They should add details about the degrees of the angles, and whether they are acute, obtuse, or right.

- EVALUATE: Give students the following problem to solve: Imagine that they are installing solar panels, but the solar panels can only face east or west. The solar panels will be in the shade at the angles of 15° to 65° and again from 120° to 135°. Which direction should the panels face to get the most sunlight? Explain why this is the case using sketches, diagrams, and/or words.
INTRODUCTION TO RENEWABLE ENERGY

AGES
9-11 years old

CONTRIBUTED BY
Education Outside
San Francisco, California
www.educationoutside.org

In this lesson, students learn about renewable energy and explore solar, wind and hydroelectric energy using hands-on models. Before using this activity, students should have already explored the concept of “energy” and its sources.

MATERIALS
- Whiteboard and markers
- Science notebooks
- Pinwheel supplies: unused pencils, pushpins, pinwheel template: http://1.usa.gov/1NuyZes
- Model windmill generator
- Model solar panel or garden solar feature
- Posters or other information about renewable energy sources (solar, wind and hydro)
- Resources can be found at: http://bit.ly/EOpath

PREPARATION
- Write the word “renewable” on the white board. Set up three renewable energy stations with supplies, models and information about different energy sources.

DIRECTIONS
- Begin by asking students a few questions: What does the word renewable mean (able to be replaced by nature)? What are some examples of sources of energy that are non-renewable (burning oil, natural gas or coal)?
- Ask students to discuss forms of energy that are renewable with a partner, and list examples of naturally occurring energy in “nature” (waves, wind, sun, etc.). Take suggestions from volunteers to share with the class.
- Tell students that they are going to learn about three sources of renewable energy today: solar, wind and hydropower. Using informational posters for help, discuss each form of renewable energy: What forms of renewable energy have the students seen before? (A local dam? a wind farm? solar panels?) How do they work? Where does the energy come from and go?
- Divide students into three groups and ask each group to start at one of the stations. Give students 5-8 minutes at each station, depending on the available time.
- WIND POWER GROUP: At this station, students will make pinwheels to demonstrate how a wind turbine works. They can also play with a model windmill generator.
- SOLAR POWER GROUP: At this station students experiment with a solar powered fan or another schoolyard solar feature such as a solar powered pond pump, observing what happens when the panel is partially blocked.
- HYDROPOWER GROUP: At this station students will use water from a hose or watering can (or a water feature, if the school garden is equipped with one) to rotate a waterwheel.
- After each group has had a chance to rotate through each station, reconvene the students and ask them to share one thing they learned about renewable energy with a partner. Ask one volunteer from each group to share their comment with the entire class.
- End the lesson by asking students to recap the lesson’s objectives in their science notebooks. Ask: What is the difference between renewable and non-renewable energy? What are three forms of renewable energy?
HOW COOL IS YOUR SCHOOLYARD?

AGES
8-18 years old

CONTRIBUTED BY
Green Schoolyards America
Berkeley, California
www.greenschoolyards.org

Why are cities often hotter than the surrounding countryside? In this activity, students study the microclimates on their schoolyard and explore the influence of the built environment on surface and air temperatures. They will use infrared and standard outdoor thermometers to measure and compare the temperatures of the air, pavement and natural areas.

MATERIALS
- One handheld infrared thermometer for measuring surface temperatures (e.g.: http://bit.ly/Fluke62)
- One standard outdoor thermometer, for measuring air temperature, attached to the top of a meter stick. (Use this to measure air temperature at a consistent distance from the ground, approx. the height of a young child.)
- Notebook(s) and writing materials to record findings

BACKGROUND
- Man-made surfaces, such as buildings, asphalt, concrete, rubber and metal often trap and store more heat from the sun than vegetation and other natural materials such as trees, grass, wood and soil.
- We can cool the temperature of our schoolyards—and cities—through our choice of materials; for example, by replacing pavement with plants and adding trees for shade. (See: http://bit.ly/EPAtemp) This is important to understand as the effects of climate change increase.

DIRECTIONS
- Lead a brief discussion about microclimates, factors that influence them, and why this matters. Ask: “How do different materials in our schoolyard influence local temperature?” Walk outside onto the school grounds with a class on a warm, sunny day. Observe and discuss the wide range of materials used onsite. Ask students to hypothesize which areas of the yard are the warmest, coldest, and why?
- Identify five or six areas within the yard that the class believes have different microclimates, to be your “study areas”. You might consider including: a patch of asphalt in full sun and one in full shade; a concrete sidewalk; a shady tree grove; a soil-covered garden bed; a metal slide; rubber safety mats; a natural lawn; artificial turf; etc.
- Establish set intervals for measuring temperatures in the study areas and decide on the length of your study. E.g., plan to take measurements once per hour (with different classes), from 9:00 am - 4:00 pm, for a week. Create a data table for the class(es) to share to record their measurements.
- Model how to use both types of thermometers, following all of the directions for use of your infrared thermometer. (Some infrared thermometers require a different setting for each material to properly measure surface temperatures; others only have one setting.)
- Divide students into teams and distribute responsibilities for taking measurements of the surface temperature and the air temperature at the appropriate times and in each of the specified locations. Ask students to record their findings on the shared data table.
- When the data have been collected for the entire study period, analyze the results with the class(es). What patterns did you notice? Which areas of the school grounds were the warmest and coldest? Do any of the areas on the grounds get dangerously hot? (>111°F can cause pain; >140°F can cause burns) After drawing out patterns, ask students to develop explanations for how and why these patterns might exist. Then have students apply their working hypotheses to generate ideas about how to cool the hottest temperatures onsite.
Harness the power of the sun to create “photographs” of natural materials on fabric. Botanists in the 1800s utilized cyanotypes, an early photographic process, to capture the images of plant specimens. You can mimic that process using fabric paint, the natural materials found on your school grounds, and infrared light from the sun.

**MATERIALS**
- 100% cotton fabric (e.g. muslin), cut to fit on a clipboard
- Clipboards, 1 per child
- Masking tape
- Setacolor Transparent Paint in at least 3 colors (available online, e.g.: http://bit.ly/SetaColorPaint)
- Small cups and foam paint brushes
- Water
- Natural materials you collect such as flowers, petals, leaves, feathers, twigs, small rocks, and blades of grass

**DIRECTIONS**
- Attach the fabric to the clipboards and add masking tape to secure the bottom corners. You’ll need one per child.
- Pour small amounts paint into cups and dilute with a few drops of water. Stir to blend. Put one brush in each cup.
- Let the children explore the environment, collecting natural materials such as flowers, petals, leaves, feathers, twigs, small rocks, and blades of grass.
- Show the children how to use a foam brush to paint the fabric with the diluted paint. Be sure to cover the entire piece of fabric. The colors will blend like watercolors.
- Encourage the children to arrange the natural materials they collected on top of the painted fabric. Press flowers, petals, and leaves so they adhere to the damp fabric. Use pebbles to weigh down the corners of large leaves or any materials that are not flush with the fabric.
- Place clipboards with attached fabric in the sun until they are dry. Drying takes 15-60 minutes, depending on how bright and warm the day is. Once dry, carefully remove the natural materials to reveal the prints on the fabric.
- Use your sun prints as placemats, flags, or bandanas. String them together to make a banner. If you plan to wash the sun prints, iron the fabric to set the color.

**HOW DOES IT WORK?**
- Water evaporates from the fabric exposed to sunlight faster than the fabric covered by the natural materials. As this happens, the drying fabric sucks the moisture, including the paint pigment, from the fabric covered by the natural materials. This leaves a shadow of faded color where the natural materials were covering the fabric. (On really hot, sunny days those areas will be white.) Although this is different than the chemical process used by botanists creating cyanotype prints on paper, the technique and results are similar.
MAKE A SOLAR ETCHING

AGES
8-18 years old

CONTRIBUTED BY
Rahus Institute - Solar Schoolhouse
Sebastopol, California
www.solarschoolhouse.org

Many years ago, people would start their family’s cooking fire using mirrors or glass to focus sunlight into a high temperature beam. The power of sunlight can also be used to make artistic creations with the aid of a magnifying glass. Solar Schoolhouse learned of this technique from Solar B, a Santa Barbara artist who “solar carves” amazing artwork using only sunshine. You too can be a Solar Artist!

MATERIALS
- Magnifying glass (2x or 3x magnification, 4” diameter)
- Protective eyewear for each student (welding goggles, Shade #5, 50mm)
- One or more clean pieces of wood per student
- Pencils

DIRECTIONS
- Ask students to choose a piece of wood, and then draw or write something on the wood with a pencil.
- Students should sit outside in a comfortable, sunny place, with the sun shining over the shoulder that matches the hand they use for writing (either to the right or left).
- Ensure that each student puts on protective eyewear before they begin to etch.
- Students should hold the magnifying glass with the lens perpendicular to the sun, above the wood.
- Slowly move the lens closer to the wood, making sure the light beam is a perfect circle, and focusing it until it gets as small as possible. It should start burning at this point. If the lens gets too close to the wood, the beam will start to enlarge and it will stop burning.
- To etch the design, move the beam in the direction of the pencil line, traveling slowly back and forth, and going further forward with each pass.
- As you can see in the picture, the lens bends the heat essence of the sun and concentrates it. On a clear day, the temperature of a totally focused beam can reach over 800 degrees Fahrenheit!! Do not allow this hot point of light to come in contact with students’ skin or flammable clothing. Always be safe and have fun!
This activity introduces students to the First and Second Laws of Thermodynamics through a water relay race. This also demonstrates the inefficiency of coal energy production, which supplies almost half of our nation’s electricity. Coal-fired plants are only able to use 38% of the energy stored in coal after conversion. (Source: National Academy of Sciences)

**MATERIALS**
- 1 gallon of water
- One plastic yogurt container (one pound size) with one hole in the bottom
- One plastic yogurt container (one pound size) with holes covering one-third of the bottom
- Six small paper cups (five of the cups should have one hold punched in the bottom)

**BACKGROUND**
- Energy is constantly changing from one form to another. This is called energy conversion. We use technology to convert energy stored in fuels such as coal into electricity. The first law of thermodynamics states that energy cannot be created nor destroyed. Therefore, an equal quantity of energy must exist before and after a conversion.
- Although the same amount of energy exists before and after, not all the energy is converted into the desired form. This illustrates the second law of thermodynamics: with each energy conversion, some of the energy becomes unavailable for future use. “Efficiency” describes how much of a given amount of energy can be converted from one form to another useful form.

**DIRECTIONS**
- Tell students they are going to simulate what happens to the chemical energy in coal as it is converted from one form to another during the electrical generation process. The water will represent the energy within coal (and electricity and light) and not the coal itself.
- Go to a large outdoor grassy area and divide the class into teams of eight students.
- One student (representing a coal miner) will take one cup of water with a hole in the bottom and transfer water from the gallon to a student holding the yogurt container with one hole in the bottom.
- The student holding the yogurt container with one hole in the bottom (representing transportation, such as a train) will carry the water to a third student holding the yogurt container with many holes (representing electricity generation).
- The water then goes down a line of four students in a row, who are each holding a cup with a hole in the bottom (representing a power line).
- The final student in the line will pour any remaining water into the cup without a hole (representing a light bulb) held by the last student. The relay is done when the cup is filled or when water runs out.
- Discuss energy production and efficiency with students.

**ADDITIONAL RESOURCES**
Thoughtful Use of Materials

Every school chooses to include in its environment says something about its values. Over the last few decades, as the green building movement has grown, many schools have started to question conventional playground materials—asphalt, concrete, stainless steel, plastic and rubber—that are widely used. Schoolyard landscape features designed using sustainable, natural and recycled building materials demonstrate green building practices to the school community and can reduce the school district’s costs and impact on landfills and other urban infrastructure.

NATURAL MATERIALS  Living plants, wood, bamboo, straw, stone, sand, clay, adobe, snow and other natural materials are teaching tools for lessons about environmental stewardship and time-tested building techniques that are still relevant today. They lend themselves well to artistic expression and cultural connections, and to community participation in schoolyard construction and stewardship. Plant-based materials are gentle on the Earth and can be composted at the end of their useful life. The decomposition process returns valuable nutrients to the soil.

RECLAIMED AND RECYCLED MATERIALS  Using salvaged building materials on school grounds diverts bulky waste from landfills and recaptures the remaining value of the materials for further use. It reduces the need to mine, harvest, process and transport new materials, which in turn, saves additional energy and effort, and preserves environments at the extraction source.

THE NATURE SWAP

AGES
2-8 years old

CONTRIBUTED BY
Nature Kids Institute
Orangeville, California
www.naturekidsinstitute.org

Transform your plastic and unimaginative playthings into unbridled creativity by replacing play accessories with nature’s loose parts!

MATERIALS
• Leaves, sticks, pine cones, rocks, acorns, pine needles, seashells, flowers, seed pods and other natural materials.

DIRECTIONS
• This activity restores a child’s right to imagine and create their own fun! Does your play space for young children contain a play kitchen with plastic food? How about a toy barn full of animals, a doll house with dolls, or even a painting easel with brushes? If so, it’s time to let nature shake things up!
• Leave the play kitchen but remove the food, leave the barn but remove the animals, leave the doll house but remove the dolls, and (our absolute favorite) leave the painting easel but remove the paintbrushes.
• Challenge children to find their own “food,” “animals,” “dolls” and “paintbrushes” using natural elements found around the school or natural materials that you provide.
• You will be amazed by how creative children can be when they are not limited by the manufactured toys we offer them. Suddenly, little chefs are able to cook up anything they want, unheard of animals move into the barn, dolls become free to embody the full range of human diversity and behavior, and painting becomes a much more complex and tactile experience. In this play scenario, the creative decisions come from within the child instead of from without.
Students greatly benefit from having natural elements in their schoolyard landscape that they can explore and use—depending on their age—to enhance their imaginative play, develop gross motor skills, incorporate into their academic studies, or enhance informal relaxation spaces. This project places boulders, tree rounds or logs in the schoolyard landscape. It is intended to be undertaken during a community workday or by school district facilities staff or a hired contractor.

### MATERIALS

- Tree rounds or logs from long-lasting hardwoods like cedar or redwood; minimum 18” diameter x 18” long
- Boulders, a minimum of 18” in diameter
- Open-graded aggregate base rock, to place under the logs
- Winch, tripod, digging bar and other appropriate tools
- Work gloves, safety glasses and any other safety equipment deemed necessary for the activity
- Adults to supervise children, if they are involved, and to keep children’s participation safe and age appropriate
- Insurance for volunteers, via the school, district or PTA
- Camera

### DIRECTIONS

- Recruit adult volunteers from the school community to assist with construction and lend tools to the project.
- To place tree rounds:
  - Mark the ground to indicate where you wish to place the elements. Explain this layout to the assembled volunteers. Dig holes in the soil that are a few inches wider than each tree round you will be using, following your plan. The holes should be deep enough to accommodate a 6” bed of compacted base rock plus half the height of the tree rounds.
  - Fill the holes with 6” of base rock; compact it firmly. Place the tree rounds in the ground, with at least half the height below the finished grade and the other half above ground. Fill the hole around each piece of wood with additional base rock up to 3” below finished grade, and compact firmly. Add wood chip mulch to the top of the holes to match the surrounding landscape.
- To place boulders:
  - Place boulders in the ground on compacted native soil, at least 1/3 below the finished grade with the other 2/3 exposed above the finished grade. Fill the holes with native soil and top with mulch, as desired.
A forest, in order to thrive, needs nutrient-rich mulch (fallen leaves and branches) to be converted to healthy humus—exactly what trees and plants need to grow! Composting is our attempt to promote the process of decomposition by recycling our yard clippings, food scraps and other organic matter. Using compost to feed the soil, we can divert our organic matter from landfills and convert it into soil for our school and community gardens.

**MATERIALS**
- Mixing bowl, spoon and apron
- Baking pan filled with organic compost
- Container of water
- Separate bowls of dried leaves, branches, food scraps and grass clippings
- Compost bin (or picture)

**DIRECTIONS**
- Explain to the students that they will observe a demonstration by the Compost Gourmet who specializes in turning trash into treasure!
- Ask the students, “What do you think is natural trash?”
- Set up a demonstration separating the bowls of items by “greens” (high in nitrogen—food scraps and grass) and “browns” (high in carbon—dried leaves and branches, including the mixing bowl, spoon and water).
- Wearing your apron, proceed as the “Compost Gourmet”. (Silly voice is optional.)
- Use the following script, modifying it as you choose:
  “I am going to show you how to turn what some people think is trash, into treasure! Look at these ingredients! What do we usually do with them?” (Throw them away.) “Not in my kitchen! All of these can be turned into compost. Compost is rich soil that is used to grow food and plants. Using a special recipe, I will mix these together to make compost. The perfect recipe calls for an equal blend of nitrogen and carbon. These are important elements for making soil. For our recipe we’ll call nitrogen-rich ingredients “greens”. Green ingredients are moist, like grass clippings, food scraps and garden weeds.” (Display some samples.) “The carbon-rich ingredients we’ll call “browns”. Brown ingredients are dry like bark, branches and dry leaves.” (Display some samples.)
- Invite students to come up and add equal parts of green and brown ingredients to the mixing bowl, stirring it and adding water.
- Demonstrate that the last step is to put it in the oven. “Do you think I should put it in a regular oven?” Share that the ingredients for compost go into a compost bin (show the bin or a picture), and that it acts like an oven. All the micro-organisms work so hard to process this material, that the compost bin actually gets hot inside. In about 3 months we have our finished product—compost.
- Pull out a sample showing the baking pan filled with organic compost. Allow students to smell it, feel it and add handfuls of it below a tree.
TRADITIONAL USES OF CALIFORNIA NATIVE PLANTS

AGES
8-18 years old

CONTRIBUTED BY
Living Classroom
Los Altos, California
www.living-classroom.org

This lesson is intended to coincide with the 4th grade Social Studies topic of California Indians. Students will learn about various plants that the Indians used for housing, baskets, food, medicine and tools. Students learn how plants were crucial to the survival of Native California Indians and can find many of the plants in their school’s own native plant garden. Students will also gain hands-on experience with the plant material.

MATERIALS
• Laminated pictures of tule houses and tarweed gatherers
• 2 arrows, bow, arrowhead, cutting tool, dipping gourd, elderberry flute, or soap root brush (the more variety to demonstrate, the better)
• Tule basket or deer grass mat / basket
• Ethnobotany story hand outs (http://greenschoolyards.org/lsylinks)

DIRECTIONS
• Instructor: “How many stores did the California Indians have?” Answer: They had to find or make everything.
• “Today we’ll learn about plants they used and relied on for their survival. This is called ethnobotany (ethno=people and botany=plants), how plants are useful to people. How did they make their houses?” With poles and thatch from plants (show picture).
• “What did they use for medicines?” Plants. “Today we still use plants for medicine like aspirin whose natural form is found in willow tree bark.”
• Some medicinal examples:
  - Teas—from mint, sage, elderberry, rose petal—to drink for stomach aches, headaches, fevers, etc.
  - Poultices made by grinding up plants—like yarrow, sage, lichen, buckeye—mixed with water or oil and applied to skin to heal wounds, bug bites, etc.
  - Scattered plants as bug repellent in houses—like bay leaves to repel fleas.
• “What did they eat?” Some meat, some fish and clams, but lots of plants; much more variety than we eat today, including all kinds of berries, seeds and roots.
• “Their main winter food was acorns. Why?” They were abundant and could be stored.
• Lastly, show the bow made from elderberry, the arrows with an obsidian tip and a glass tip, the skirt (Ohlone), elderberry flute and soap root brush, elderberry game of staves. (Soap root was used for soap, food, glue, medicine, poison and more, all from a hairy, fist sized underground bulb.)
• Now, transition the students by telling them they are going to walk through the garden and look for the plants that they would use to complete their ethnobotany story. Assign pairs and hand out the ethnobotany story. Tell students that they are to read the story and look for the plant that would serve the needs described in the story. Ask them to include the name of the plant in their story. They should also read the plant sign (if the instructor has labeled it) for more information about the plant.
• After this exploration in the garden, ask the students: “Are you ready to gather and live off native plants like the Native Americans did? How does California Indians’ knowledge of plants compare with your own knowledge of plants?”
THE SCIENCE OF SOIL TESTING

AGES
14-18 years old

CONTRIBUTED BY
The Huntington Library, Art Collections and Botanical Gardens
San Marino, California
www.huntington.org

Healthy soil is the key to a healthy garden. But how do you know what kind of soil is in your garden, and which plants will thrive in that soil? These “layers” of activities guide students in testing the soil make-up for a fuller perspective, and they are adapted from our on-site program, “Farm to Plate: Connecting with Our Food at the Ranch.”

MATERIALS
• Soil from the school garden
• Magnifying glass
• Cups
• pH strips with reference scale
• Shovel
• Hose or watering can
• Ruler
• Mason jar with lid
• Soil texture triangle: http://1.usa.gov/22Bpb9s

DIRECTIONS
• Begin by encouraging students to observe a soil sample from the garden. Ask them to use their senses to describe what the soil looks like, feels like and smells like.

PART I – Soil pH
• Ask students to fill cups with small soil samples from different parts of the garden. If it is dry, add enough water to moisten. For each sample, have students put the pH strip in the soil for a few seconds and then identify the pH color on the strip. Discuss if the results are uniform or if there is variation on your site. Knowing the pH of the soil is the first clue to what kinds of plants might be well-suited to that garden.

PART II – Soil Drainage
• Ask a student to dig a small hole in the garden, approximately one foot wide and one foot deep. Have another student fill the hole with water, and then stand the ruler in the hole. Time how long it takes for the measured water to drain into the soil. Discuss what conclusions can be drawn from the results. Knowing the drainage tendencies of the soil is the second clue to what kinds of plants might be well-suited to that garden.

PART III – Soil Texture
• Ask a student to fill the mason jar two-thirds with water and then add garden soil until the jar is almost full. Put the lid on the jar and shake until the soil has broken into particles, then set it to rest. After a few minutes, a layer of sand will form; after about an hour, a layer of silt; and after about a day, a layer of clay.
• Ask students to estimate the percentage of each of the three soil layers, and then have them locate that percentage balance on the soil texture triangle. The result will indicate the type of soil that is in their garden, and it will offer them more insight regarding the soil pH and drainage results. Then ask students to deduce what kind of plants might be successful or unsuccessful in the garden.
THINK BEFORE YOU THROW: 4RS RECYCLING RACE

AGES
4-18 years old

CONTRIBUTED BY
Green Schools Initiative
Berkeley, California
www.greenschools.net

In this activity, children learn about what everyday products are made of and what happens when items come to the end of their useful lives. This includes learning about the 4Rs and how to sort their waste properly as compost, recycling and landfill trash to reduce their environmental impact on the Earth. Students practice sorting and have fun with a Recycling Relay Race.

MATERIALS
- A large bag with examples of waste students encounter at school, including at least one example of each type of waste (items to be composted, recycled and landfilled) per team. For example: used classroom paper, empty milk cartons, empty yogurt containers, paper napkins or towels, chip bags, paper plates, plastic bottles, aluminum cans, plastic forks and non-messy food waste (e.g. banana peels)
- Each team of students needs: one trash bin labeled “Landfill” (with a black bin or black sign), one recycling bin labeled “Recycling” (with a blue bin or sign), one compost bin labeled “Compost” (with a green bin or sign)

DIRECTIONS
- Before you begin the activity with students, attach waste station signs to the bins and bring them outdoors. In the schoolyard, 5-10 yards from the bins, arrange one pile of mixed waste per team, to be sorted by students during the race. Each pile should have the same number of items and the same examples of waste to sort.
- Gather students outside near the prepared materials and tell them about the 4Rs. Ask if they’d like to be an Earth Protector (or other eco-hero). Tell them that everything we use is made with resources that come from the Earth—our clothes, houses, food, books, cars, computers, toys and iPhones (modify for age). When we are done using our things we often throw them “away”. Ask students: “Where do things go when we throw them away?” Answer: There is no such place as “away” because we only have one Earth. It all goes somewhere—to the landfill, or a recycling plant or a compost pile. The less we use, and the less we bring to the landfill, the more we save resources, replenish soils and protect our Earth.
- WASTE SORTING: Show an example of each item when you explain the activity. Ask what each item is made of and whether it can be recycled or composted (rotted) or whether it is landfill trash. Demonstrate where each item can be disposed of properly (in matching bin). Plastic items go to the landfill. Paper, bottles and cans can be recycled. Food-soiled paper, milk cartons and food waste can be composted. Tell students that it is important for them to “Think Before You Throw” and to practice the 4Rs. Ask the students if they understand the 4Rs.
- RECYCLING RELAY RACE: Divide students into teams and ask them to line up behind each waste pile. Each student will pick one item, race to their waste bins, and put the item in the proper bin (landfill, recycling, compost). When they return to their pile, the next student takes a turn. The team that completes the race first and gets the most items in the correct bins wins.

THE 4RS
REduce – Use fewer things, so less is wasted
ReUse – Use durable goods, not disposable ones
ReCycle – Turn old materials into new ones
Rot – Compost organic matter to create rich soil
Community Engagement

School grounds are unique public open spaces. They are community resources that are fully occupied during the school day—but may also be used when school is not in session to enhance the well-being of residents in the local neighborhood and the surrounding community.

FESTIVALS AND SPECIAL EVENTS Green schoolyards can be venues for school-related public events and celebrations that draw parents and other family members further into their child’s education and invite neighbors and the wider community to participate in life at school.

STEWARDSHIP The process of building and sustaining green schoolyards connects communities to place, and helps to engage students, teachers, staff, parents, neighbors, businesses, nonprofits, public agencies and others in collaborations to care for and improve their shared public space on school grounds. This cooperation reinforces interdependence and local self-reliance, and builds a “sense of community” while creating useful, beautiful school environments at affordable prices. Students and members of the school and local community can help to design green schoolyards and also often participate in schoolyard work days to build, plant and maintain elements of the school grounds.

JOINT USE Some living schoolyards become part of their city’s public park system after hours, providing access to green space and recreation for students and other members of the local community when school is not in session.

ACTIVITIES IN THIS CHAPTER

- **Family Campout in the Schoolyard**
  Event / family engagement (6-18 years old) 142
- **Create an Insect Hotel**
  Stewardship / insect habitat (3-18 years old) 143
- **Botanical Traditions Garden**
  Stewardship / horticulture (3-18+ years old) 144
- **Build a Wildflower Hugel Mound**
  Stewardship / horticulture (5-18+ years old) 145
- **Inspirational Tree Mural**
  Stewardship / art installation (5-18 years old) 146
- **Build a Hoop House**
  Stewardship / horticulture (8-12 years old) 147
- **Plant a Native Hedgerow**
  Stewardship / wildlife (8-18 years old) 148
- **Cold Frames**
  Stewardship / horticulture (9-18+ years old) 149

- **Birdhouse Building**
  Stewardship / bird habitat (8-18 years old) 26
FAMILY CAMPOUT IN THE SCHOOLYARD

AGES

6-18 years old

CONTRIBUTED BY

Outdoors Empowered Network
San Francisco, California
www.outdoorsempowered.org

This activity can be a terrific team builder for families whose children share a class or a grade level, or for an entire school community. Enjoy the sights and sounds of nighttime in your neighborhood and use this activity as a springboard for school camping trips to regional parks in your area!

MATERIALS

- Tents, sleeping bags, sleeping pads and flashlights are the most essential items. Some families might be able to provide their own gear. Others may not have tents, sleeping bags or other equipment. Camping gear can be borrowed from gear libraries in a small but growing number of cities (see: http://bit.ly/OENetwork) and many outdoor gear shops have rental programs.

- It’s very helpful to have somewhere to cook outside in the schoolyard, and if possible, a place to gather around a campfire. If you have an existing outdoor oven or fire pit on school grounds, that’s a wonderful place to cook and share a meal. If not, other options include a portable steel “fire pit,” portable camping stoves or BBQ grills (which encourage parents to get involved). Be sure to obtain proper permission from your school district to cook outside during your campout. Invite the local fire department to join you if you need help setting up and managing a temporary fire pit.

- Food to share for dinner and breakfast (e.g. potluck)

DIRECTIONS

- Pick a date: fall or spring is best. You may want to start with a spring event and move it to the fall once you’ve built a tradition people are looking forward to!

- Obtain permission from the school district for staff, students and their families to be onsite overnight. Because your campout is at school, you probably won’t need the same “field trip” form that you use to leave the site.

- Advertise your event. Notify families about the campout as far in advance as possible to build excitement. Send multiple announcements and encourage attendance by announcing a BBQ dinner and s’mores.

- Ask for RSVPs that include whether families have their own gear. Arrange to borrow and pick up the camping equipment for families in your school community that don’t have tents, sleeping bags, etc. If you live in a city that has an Outdoors Empowered Network member organization, inquire about the camping training sessions they offer and gear library access, since their gear can be borrowed for FREE. Some local outdoor specialty stores may also be willing to rent/loan gear. http://bit.ly/GearCommons also loans tents through a peer-to-peer gear sharing program.

- Recruit volunteers who can arrive early on the day of the event to help set up the camp site and assist families with their tents. Serve dinner after the group is settled. After dinner, roast marshmallows and make s’mores if you can, since this is an activity that is guaranteed to be popular. Let the kids play with their flashlights and get their teeth brushed, then make time for storytelling around the fire, as this is a great way to settle the kids down. Stargazing might be possible, and is a terrific tie-in to science curriculum. After kids are off to bed, parents can spend more time getting to know one another in an informal setting.

- In the morning, serve breakfast and include everyone in clean up activities. Be sure to leave time for taking down the tents. Wet tents will need to dry before they are stored.
CREATE AN INSECT HOTEL

AGES
3-18 years old

CONTRIBUTED BY
IPS School 60 / Butler University Laboratory School
Indianapolis, Indiana
www.myips.org/Domain/27

Insect hotels are easy-to-make homes for creatures crawling around your schoolyard. Insect hotels can be assembled using all found, recycled, or up-cycled materials. These homes provide shelter for insects including solitary bees, ladybugs, and beetles, just to name a few! These beautiful homes provide yearlong shelter for insects you want to keep in your garden, while also contributing to your local ecosystem. They can be built with students and/or during a community work day.

MATERIALS
• Collect natural materials from school grounds and ask children to bring additional materials collected from home. For example: cork, brick, blocks of wood, bamboo, rocks, sticks, pine cones, seedpods or cardboard.
• A wooden box or open birdhouse that has an overhanging lip to keep the elements out; any size will work.
• Strips of wood
• Wire to hang your box, or a post to mount it on (It’s important for the final project to be elevated.)
• A drill and a range of drill bit sizes
• Wood glue

DIRECTIONS
• Measure the depth of your insect hotel frame and cut all of your materials down to size if they are too long.

• If you have a large box, nail strips of wood inside to create sections or “rooms.”

• Begin adding materials at the bottom of your hotel and then work your way up. Add drops of glue as you go to keep materials in place.

• Use a variety of materials and sizes in different compartments to attract diverse insects and to create a visually appealing structure. Keep in mind which insects you primarily want to attract: drilling varying sizes of holes in wood attracts bees, bark can attract spiders, beetles, and centipedes, while ladybugs are attracted to sticks and leaves.

• Place the insect hotel near a garden or green area that provides essential food for butterflies, bees and other flying insects.
This activity is based on the Botanical Traditions Course at Temple University’s Ambler Campus, and describes how to convert a grassy field plot into a garden of plants traditionally used for food, medicine and dye. The activity can be used as the basis of a single lesson or a whole semester. The perennial plants come back year after year, providing course material that requires minimal maintenance. Our garden plot is 40’ x 85’. The garden grew from a patch of grass to a 40’ x 40’ garden from June to December. Our curriculum included teaching students how to identify, grow, harvest, store and prepare plants for food, medicine and dye. Students also created a design for a garden at their home.

MATERIALS
- Newspapers or cardboard
- Shovels, spades, rakes
- Compost
- Wood chips
- A variety of food plants, suitable for your climate
- Medicinal plants: aloe vera (warm climates), calendula, echinacea, lemon verbena, peppermint, yarrow, etc.
- Dye plants: beets, berries, bronze fennel, goldenrod, hops, indigo, marigolds, onions, purple iris, red cabbage, etc.

DIRECTIONS
- Identify an unpaved plot of land on your school grounds that receives full sun. Seek permission to convert this space into a garden. If this space is covered in grass when you begin, that’s fine. This technique will grow a beautiful garden directly on top of grass without the need to till and will eliminate the grass naturally.
- Open a newspaper fully. This will be the size of your garden row. Lay the newspapers down on the grass or bare soil.
- Lay another open newspaper next to this one, overlapping about ¼ of the original newspaper with the new one.
- Put 8” -12” of compost on top of the newspaper row. If it is windy, ask someone to help hold down the newspapers and apply the compost as you lay the newspapers. With a straight spade, dig both edges of the newspaper into the ground at each end of the garden.
- Lay another row of newspapers next to the composted row and use the same technique. This second row will be for walking, so apply wood chips on top of the newspaper.
- Repeat this pattern to fill your space and fulfill your planting needs. Now you are ready to install the plants. Water thoroughly and allow the compost and newspaper to absorb the water. Dig the plant starts into the compost, arranging as desired. Be careful not to pierce the newspaper.
- CURRICULUM: We started our garden at Temple University in June, and created space for making potions, drying plants and meeting in an outdoor classroom. I tailored my curriculum the following fall around the existing plants, based on what was growing best. Our class made a variety of plant products including: dandelion salad, calendula oil/salve, chickweed pesto, boneset tincture, dandelion vinegar, violet syrup, and slippery elm throat lozenges. We also included dye plants, and dyed fabric and yarn with marigolds, goldenrod and black walnut hulls. For step-by-step pictures of our Botanical Garden creation, visit www.SustainabiltyEd.com Enjoy!
BUILD A WILDFLOWER HUGEL MOUND

AGES
5-18+ years old

CONTRIBUTED BY
New Horizon School
Pasadena, California
www.newhorizonschool.org

A hugelkultur mound is a no-irrigation raised-bed system created by stacking logs and mounding soil over them. The activity of building a hugel mound will provide a way to teach and learn about water harvesting and the process of building healthy soil. This building project should be accompanied by a lesson on the importance of infiltrating rain water on site, building soil fertility and capturing moisture. This activity works well as part of a community work day, where parents, students and community members come together to build this drought tolerant garden.

MATERIALS
- Twenty bags of steer manure or compost (often free or available inexpensively from a local farm or ranch) and some top soil
- Wood chips or straw to use as mulch
- Local wildflower seeds such as: California poppies, white yarrow, collared annual lupine and purple needlegrass, or seeds appropriate for your own area. (Ask your local botanical garden for ideas.)
- Collect: fallen logs (2-3 foot long segments are manageable for two students), branches, twigs, fallen leaves, compostable food wastes

DIRECTIONS
- Identify an area in your school that would be appropriate for local wildflowers and has good sun exposure. Try to place the garden beds in an area where the school community passes or congregates often, so that the blooms can be enjoyed by everyone. Select a location that is already unpaved (bare soil, grass, etc.) Consider the wind direction, too, as this will capture moisture from the air.
- Lay the logs down as the first layer of the hugelkultur bed. Place the largest logs on the bottom, and smaller logs above them. Next, add a layer of branches and then a layer of small sticks and twigs. Water these materials until they are soaked.
- Fill the spaces between the logs and branches with leaf litter and organic materials such as food scraps. Top off the mound with 1-2 inches of soil and a 3 inch layer of mulch. Sprinkle with native wildflower seeds.
- Water generously upon completion and then water lightly once a week until the plants are established. (Plants usually take one month to become established.)

References: Leigh Adams, artist and sustainable agriculture consultant at the Los Angeles County Arboretum, taught this passive water harvesting technique at New Horizon’s free community workshop series. The poster above was created by Zainab Eltaib, 8th grader at New Horizon.
EcoRise Youth Innovations is dedicated to empowering youth to become the change-makers of our future. This activity encourages students to beautify their shared public space through inspirational mural artwork. The mural project can creatively communicate and educate viewers about local environmental issues pertinent to your community.

**MATERIALS**
- An available, solid-colored wall or paved ground surface
- Projector
- Transparencies
- Exterior paint, paint brushes, and drop cloths

**PREPARATION**
- Locate a suitable wall or surface and obtain the necessary permissions to add a mural. Determine any preparation the site may need, such as cleaning, adding a base coat, etc.
- Come up with some ideas for a mural that includes a favorite local tree or species of tree.

**DIRECTIONS**
- Discuss how a mural can be a wonderful addition to a space and a terrific way to communicate an important message to the public. Explain that the group is going to paint an inspirational tree mural, inspired by their ideas.
- Talk about the importance of trees in our lives. What do they provide for us? What do they provide in nature? Share the names and images of common local trees. What are the differences among the trees? Are some evergreen? Deciduous? Fruit bearing? Nut bearing? Native? What is the difference in their leaf shapes? How are their barks different from one another? Are they slow growing? Fast growing? See if students can identify any of the trees nearby. Explain that one of the most effective ways to help support the environment is by planting lots of trees.
- Take students to the designated mural space and discuss what shape of tree would be the best fit. Then ask the group to choose the tree they would like to paint.
- Next, discuss the words, messages, and themes that students would like to include in the tree mural. Ask the group to consider what is important to this community and how the mural can help support that message. Ideas might be: loving our planet; the joy of being outdoors; the importance of taking care of nature; protecting local endangered species; etc.
- Discuss color selection with the group and create a color palette and tree-based design. Seek final approval for the design with the owner of the project site. Use a projector to transfer the image onto the wall or ground. Demonstrate painting techniques and processes. Allow students to paint the tree and fill it with inspirational messages!
Do you think plants can grow in the winter? Students will explore this question as they construct a hoop house in their garden and investigate the interactions between the hoop house, plants, sun and the growing environment. A hoop house will extend your growing season by allowing you to plant earlier in the spring and grow longer into the fall and winter.

**MATERIALS**
- Two pieces of rebar per PVC pipe, 2 foot lengths
- 10 feet of ½ inch PVC pipes or cut hula hoops
- Roll of greenhouse plastic or any clear plastic
- Weed blocking fabric or cardboard
- Tape measure, scissors, gloves
- Zip ties to attach greenhouse plastic to PVC pipe
- Mallets

**PREPARATION**
- Lead the class in a discussion about greenhouses and how they work. Guiding question: What differences can be observed between plants growing inside and outside of the hoops house?

**DIRECTIONS**
- Divide the class into two groups and perform half of the work at a time.
- Measure the garden or raised bed to see how large the hoop house will be.
- Lay down the weed barrier fabric, or cardboard so that it extends past the edges of the house by at least 1 foot. (This step is not necessary with a raised bed garden.)
- Ask students to stand on the edges of the fabric to hold it taut and in place while using fabric stables to secure the cloth to the ground.
- Use your feet to measure two paces on the perimeter of the garden bed and mark the spot by cutting a hole in the fabric/cardboard with scissors. Lay the rebar in these spots.
- Show students how to use mallets to pound the rebar half way into the ground, vertically.
- Slip each end of the PVC pipes over the rebar to create “hoops”.
- Cover the resulting rounded frames with clear greenhouse plastic when the weather is cool. Note: Remove the plastic covering when the weather is warm, so the plants inside do not overheat.
PLANT A NATIVE HEDGEROW

AGES

8-18 years old

CONTRIBUTED BY

Collaborative for High Performance Schools (CHPS)
Sacramento, California
www.chps.net

A hedgerow is a linear arrangement of closely spaced shrubs and trees designed to create a fence-like border, serve as a barrier or mark a boundary. In a schoolyard context, a hedgerow can also act as a windbreak, create shade and promote habitat for beneficial insects and birds. Plants in hedgerows can be chosen for a variety of services that support a nearby school garden, such as: masking crop plants from pests, deterring pests with their scent, enticing pests away from crops, and serving as nurse plants and food sources for beneficial insects that assist in the management of organic gardens.

MATERIALS

• Mixture of native hedge plants (mostly perennial shrubs)
• Well-rotted manure or peat-free compost
• Cardboard
• Shovels, trowels, spades and/or forks
• Gloves
• Bark, mulch, straw or grass clippings
• Pruning shears
• Stakes or bamboo sticks

DIRECTIONS

• Decide where the hedge is to be planted. Consider linear spaces around the perimeter of a school garden or other school ground boundary between adjacent uses.

• Source native hedgerow plants from your local nursery.

• Mark planting locations 12 inches apart in the designated row using stakes or bamboo sticks. Double rows may be needed, or even triple rows, if your site is very exposed to the wind or if you would like to create a dense boundary. If you are planting more than one row, stagger the plants as in this diagram:

  X X X X X X X X X X X X X
  X X X X X X X X X X X X X

• Dig holes approximately the same depth as the height of your plants’ root balls, or as directed by your local nursery. Add a trowel full of compost or manure to each hole and mix with the native soil. Loosen the root ball of each plant slightly (so roots will not continue to grow in a circle in the ground) and place one plant into each hole. Fill the remainder of each hole with native soil and firm the soil around the plant to remove any air spaces. Water the new plants. Add a 1-foot wide strip of cardboard to the soil’s surface around the plants to deter weeds. Cover the cardboard with a thick layer of bark, mulch, grass clippings or straw.

• Clip plants to 12 inches high to encourage root development and new growth but leave a plant unclipped roughly every 10-12 feet to become a standard.

VERSATILE CALIFORNIA PLANT FAMILIES

Sages (Salvia spp.)
California lilac (Ceanothus spp.)
Manzanita (Arctostaphylos spp.)

CALIFORNIA NATIVE PLANT RESOURCES

CA native plant lists by region - http://bit.ly/1Vr8cHW
Hedgerow species to consider - http://bit.ly/1MyUss4

Cold frames integrate science, construction, and gardening, and add life and vibrancy to an outdoor space created by and made for children. These “mini-greenhouses-meet-raised-beds” can be made entirely from recycled and reused materials. With a little love and care, they can provide healthy snacks for students on a daily basis throughout the shoulder season in places like Colorado that have cold winters. Students love every part of the process: designing, building, planting, and harvesting!

MATERIALS
Look for local sources of recycled materials to find:

- One double-paned “slider” glass door
- 2” Styrofoam insulation (at least 16 square feet)
- 2 hinges
- 1 heavy-duty rope (e.g. an old climbing rope)
- 1 large screw eye bolt
- 4 pieces of wood for corners: 2” x 2” x 2’
- About 10 wooden boards, 2” x 6” x 5’ (any 2-by size available is sufficient)
- 1 heavy, durable object made from iron or other metal

DIRECTIONS

- Find a suitable site facing south with ample sunlight and an overhang, nearby tree, or other stable object that can be used to tie a rope which will hold the cold frame’s top open during the day.

- Choose between two design styles (at right): embedded in the ground (#1) or above ground (#2). If above ground on concrete, foam insulation must be put on the bottom in order to insulate the soil from freezing temperatures. Both styles require a thermal mass to serve as the north wall of the cold frame. A concrete wall works well on the north side. If no northern thermal mass is available, the cold frame can have a Styrofoam and wood north side.

- Plant seeds in early fall and early spring to harvest greens over the shoulder seasons. Open the cold frame during warm, sunny days. Close the cold frame at night when it is below freezing. Cover the cold frame with an insulated blanket during frigid winter nights and snowy days.

- Construct the cold frame with 2” foam insulation on the front and bottom, front and sides, or front, sides, and back. Create a pulley to lift the door. Hang a rope and a weight from a sturdy overhang or tie it to a stable tree nearby.
Contributing Organizations

The *Living Schoolyard Activity Guide* is the result of a fruitful collaboration between Green Schoolyards America and 99 other organizations across the United States, who each contributed a school ground activity that reflects their own organization’s mission, programs and areas of expertise. The diversity of ideas they shared will now enrich school ground programs across the country and around the world. We greatly appreciate everyone’s participation and extend our sincere and heartfelt thanks to this wonderful community of colleagues.

AUTHORS AROUND THE WORLD!

The map above shows the fantastic geographic diversity of the author-organizations that have contributed activity ideas to this publication series. It includes the locations of author-organizations from this publication and from the companion guide, produced by our colleagues at the International School Grounds Alliance. (Map detail from North America shown to the right.) This is truly a global movement!

Do you see your state or country on the map? If your organization helps schools use their grounds to their fullest, we’d love to include you next year! Please contact us to find out more about how to submit an activity: info@greenschoolyards.org

Organizations from the United States that contributed their ideas to the *Living Schoolyard Activity Guide* (this publication), are shown with yellow markers on the maps.

Organizations from around the world that contributed their ideas to the companion publication, *International School Grounds Month Activity Guide*, are shown with red markers.

Companion Publications

We hope you enjoyed this publication! We also invite you to download a free copy of the companion Activity Guide we developed in the same format, with additional school ground activities from around the world.

Green Schoolyards America’s Living Schoolyard Activity Guide – United States Edition (this publication) includes 111 ideas for year-round school ground activities, written by 100 organizations from across the United States.

The International School Grounds Month Activity Guide includes an additional 76 ideas for use outdoors in May, written by 51 organizations from 21 countries. It is published by the International School Grounds Alliance (ISGA) (http://bit.ly/ISGAorg) and was produced and edited by Green Schoolyards America in collaboration with our ISGA colleagues.

Together these two publications include a total of 187 outdoor activities written by 143 organizations! We hope the variety of geographic and cultural contexts in this set of Activity Guides will support your work anywhere in the world—during the month of May and year round. We encourage our readers to download and try activities from both books in this free set.

GREEN SCHOOLYARDS AMERICA

INTERNATIONAL SCHOOL GROUNDS ALLIANCE

- International School Grounds Month Activity Guide
  http://bit.ly/ISGAmay
Green Schoolyards America

OUR MISSION is to inspire and enable communities to enrich their school grounds and use them to improve children’s well-being, learning and play while contributing to the ecological health and resilience of cities.

WE BELIEVE that living school grounds can improve the well-being of children, local residents, and the environment at the same time.

WE FACILITATE public dialogue about innovative research, design, education and policy. Our programs support the living school ground movement, build relationships that help it succeed, and work to embed this perspective in our existing institutions and policy and regulatory frameworks.

WE PROVIDE resources, training and support for school districts and partner with nonprofits, businesses, public agencies and utilities to effect change across the USA.

WE COLLABORATE with educational institutions to develop comprehensive, district-wide green schoolyard programs with strong connections to local sustainable-city planning efforts, regional ecosystems, educational standards and health.

WE VALUE the uniqueness of each school and celebrate local sense of place while promoting learning, ecology, lifelong health, recreation and community engagement. We believe strongly in the value of student and community participation in schoolyard design, construction and stewardship.

WE INVITE like-minded professionals and organizations to collaborate with us to nurture and grow the movement to green school grounds for all children.

Green Schoolyards America is a national organization that expands and strengthens the green schoolyard movement and empowers Americans to become stewards of their school and neighborhood environments. We believe that school grounds are uniquely positioned to enrich the daily lives of children and their communities, occupying both the geographic and social heart of almost every city across the USA and around the world.

GREEN YOUR SCHOOLYARD

- Visit our website’s resource page for helpful articles to support your efforts: www.greenschoolyards.org
- Subscribe to our newsletter: www.greenschoolyards.org
- Read Asphalt to Ecosystems, written by our CEO, Sharon Danks, to learn what’s happening in schoolyards around the world. Available from your local library or our nonprofit publisher, New Village Press: http://bit.ly/DanksA2E
- Visit our Facebook page (http://bit.ly/GSAFBk1) and LinkedIn page (http://bit.ly/GSALI) to keep up with current research and events in this field.
- Encourage your city government and school district to adopt a Living Schoolyard resolution: http://bit.ly/CaACR128
- Please contact us at info@greenschoolyards.org if you’d like to bring living schoolyards to your school district or region. We also welcome new contributors to next year’s schoolyard Activity Guide.
In May each year, the International School Grounds Alliance and Green Schoolyards America call on schools around the globe to take their students outside to celebrate their grounds. We believe school grounds are very important for children and youth, and shape their experience of the world around them. We hope this Activity Guide, developed in celebration of International School Grounds Month and California’s Living Schoolyard Month, will encourage schools across the United States and around the world to take their students outdoors in May and use their school grounds to their fullest year-round.

The United States Edition of the Living Schoolyard Activity Guide was developed by Green Schoolyards America with written and photographic contributions from our colleagues at a total of 100 organizations across the country, including: school districts, state and national government agencies, nonprofit organizations, museums, universities, businesses and utilities. Our partner organizations contributed a wide range of exciting ideas that support learning across the curriculum, promote healthy lifestyles, and encourage play and exploration during free time, before, during and after school. Many of the activities also help children and youth connect to their neighborhood’s unique natural, geographic and cultural context.

We hope you will also enjoy the companion publication we developed with the International School Grounds Alliance, in the same format. The International School Grounds Month Activity Guide includes additional ideas gathered from our colleagues around the world. Together this publication set includes a total of 187 outdoor activities for children and youth ages 3-18, written by 143 collaborating organizations in 21 countries. Please visit our website for free digital copies of this Activity Guide set. We hope these ideas inspire you to engage in outdoor activities at your own school, wherever you live.
