Algebra A

1. [3] A polynomial $p$ can be written as
   \[ p(x) = x^6 + 3x^5 - 3x^4 + ax^3 + bx^2 + cx + d. \]

   Given that all roots of $p(x)$ are equal to either $m$ or $n$ where $m$ and $n$ are integers, compute $p(2)$.

2. [3] A function $S(m,n)$ satisfies the initial conditions $S(1,n) = n$, $S(m,1) = 1$, and the recurrence $S(m,n) = S(m-1,n)S(m,n-1)$ for $m \geq 2, n \geq 2$. Find the largest integer $k$ such that $2^k$ divides $S(7,7)$.

3. [4] Shirley has a magical machine. If she inputs a positive even integer $n$, the machine will output $n/2$, but if she inputs a positive odd integer $m$, the machine will output $m + 3$. The machine keeps going by automatically using its output as a new input, stopping immediately before it obtains a number already processed. Shirley wants to create the longest possible output sequence possible with initial input at most 100. What number should she input?

4. [4] Suppose the polynomial $x^3 - x^2 + bx + c$ has real roots $a, b, c$. What is the square of the minimum value of $abc$?

5. [5] Let
   \[ f_1(x) = \frac{1}{x} \quad \text{and} \quad f_2(x) = 1 - x \]

   Let $H$ be the set of all compositions of the form $h_1 \circ h_2 \circ \ldots \circ h_k$, where each $h_i$ is either $f_1$ or $f_2$. For all $h$ in $H$, let $h^{(n)}$ denote $h$ composed with itself $n$ times. Find the greatest integer $N$ such that there is a $h$ in $H$ such that $\pi, h(\pi), \ldots, h^{(N)}(\pi)$ are all distinct for some $\pi$ in $H$.

6. [6] A sequence of real numbers $\{a_n\}_{n=1}^\infty (n = 1, 2, \ldots)$ has the following property:
   \[ 6a_n + 5a_{n-2} = 20 + 11a_{n-1} \quad (\text{for} \ n \geq 3). \]

   The first two elements are $a_1 = 0, a_2 = 1$. Find the integer closest to $a_{2011}$.

7. [7] Let $\alpha_1, \alpha_2, \ldots, \alpha_6$ be a fixed labeling of the complex roots of $x^6 - 1$. Find the number of permutations $\{\alpha_{i_1}, \alpha_{i_2}, \ldots, \alpha_{i_6}\}$ of these roots such that if $P(\alpha_1, \ldots, \alpha_6) = 0$, then $P(\alpha_{i_1}, \ldots, \alpha_{i_6}) = 0$, where $P$ is any polynomial with rational coefficients.

8. [8] Let $1, \alpha_1, \alpha_2, \ldots, \alpha_{10}$ be the roots of the polynomial $x^{11} - 1$. It is a fact that there exists a unique polynomial of the form $f(x) = x^{10} + c_9x^9 + \cdots + c_1x$ such that each $c_i$ is an integer, $f(0) = f(1) = 0$, and for any $1 \leq i \leq 10$ we have $(f(\alpha_i))^2 = -11$. Find $|c_1 + 2c_2c_9 + 3c_3c_8 + 4c_4c_7 + 5c_5c_6|$.
