1 INTEREST AND IDENTITY OF *AMICUS CURIAE* JAMES HANSEN

2 *Amicus Curiae* James Hansen, Ph.D., appears here in his individual capacity and not as a
3 representative of any institution with which he is affiliated. The information and opinions in this
4 brief are not necessarily those of any institution with which he is affiliated or those of any party
5 to the present litigation. This brief is offered as an aid to the Court’s deliberations over whether
6 the relief sought by plaintiffs in their motion for preliminary injunction is needed to preserve a
7 climate system that is conducive to the survival and wellbeing of our children and their progeny.

8 Dr. James Hansen directs the NASA Goddard Institute for Space Studies in New York
9 City and is an Adjunct Professor of Earth Sciences at Columbia University’s Earth Institute. He
10 was trained in physics and astronomy in the space science program of Dr. James Van Allen at the
11 University of Iowa, receiving his Ph. D. in physics in 1967. Since the mid-1970s, Dr. Hansen has
12 focused on computer simulations and studies of the Earth's climate, for the purpose of
13 understanding the human impact on global climate. Dr. Hansen’s testimony to Congress in the
14 1980s helped raise broad awareness of the global warming issue. In recent years Dr. Hansen has
15 drawn attention to the danger of passing climate tipping points, producing irreversible climate
16 impacts that would yield a different planet from the one on which civilization developed. As part
17 of his work in recent years, Dr. Hansen has outlined steps that are needed to stabilize climate,
18 with a cleaner atmosphere and ocean.

19 Dr. Hansen was elected to the National Academy of Sciences in 1995.

SUMMARY OF ARGUMENT

1
2
3 Global warming due to emissions of greenhouse gases, mainly CO₂ from fossil fuel
4 consumption, is already 0.8°C, and a similar or greater amount is “in the pipeline” without any
5 further change of atmospheric composition. Already-observed impacts of this warming include
6 rising sea levels, increased atmospheric moisture resulting in more intense precipitation events,
7 higher temperatures causing more frequent and intense heat waves and droughts, loss of sea ice,
8 ice sheet mass and glaciers, expansion of the subtropics, acidification of the oceans, shifting
9 distributions of plant and animal species, and an increasing rate of species extinctions.

10 Maintaining a climate that resembles the Holocene epoch, the world of a relatively stable
11 climate system under which civilization developed, requires rapid reduction of fossil fuel CO₂
12 emissions and reforestation. Atmospheric CO₂ concentrations passed the level that is estimated
13 to be safe on the long term in, approximately, 1988; global mean temperature now exceeds the
14 Holocene peak; and unabated fossil fuel emissions continue to drive the Earth increasingly out of
15 energy balance. Unless action is undertaken without further delay, so as to return the atmospheric
16 concentration of CO₂ to 350ppm by 2100, Earth’s climate system will be pressed toward and past
17 points of no return. Effective action remains possible, but delay in undertaking sharp reductions
18 in emissions will undermine any realistic chance of preserving a habitable climate system --
19 needed by future generations no less than by prior generations.

20 Plaintiffs in this case seek a preliminary injunction to ensure that Defendants in this
21 matter submit to the Court a plan to preserve the climate system, including a cap on CO₂
22 emissions at 2011 levels by 2013, and emissions reductions thereafter by a minimum of 6%
23 annually. That prescription is consistent with scientific understanding of what is minimally
24 needed to avert truly dangerous climate change and preserve the physical status quo of a
25 habitable climate system. In light of the fossil fuel industry’s stranglehold of Congress, the
26 President’s demonstrated disinclination to utilize his authority to act, and the fact that further
27 delay vastly increases the risk of irretrievable damage to the climate system, action by this Court
28 now is essential.

1

2

ARGUMENT

3 I. INTRODUCTION: THE RELEVANT STATUS QUO IS AN ATMOSPHERE

4 THAT ENSURES A HABITABLE CLIMATE SYSTEM.

5 Plaintiffs and Defendants both appeal to the Court to preserve the “status quo.” Pl’s

6 Mot’n for Prelim. Inj. at 10; Def. Opp’n to Pl. Mot’n for Prelim. Inj. at 9. Amicus James Hansen

7 also seeks to preserve the status quo; accordingly, this brief begins with an explanation as to

8 what this implies for the global climate system.

9 Paleoclimate research conducted by Dr. Hansen and others establishes that for most of

10 the Holocene period – the period of the most recent 10,000 years – Earth’s climate, though

11 highly variable on a regional basis, has been characterized by reasonably constant mean global

12 temperatures. James Hansen et al., *The Case for Young People and Nature: A Path to a Healthy,*

13 *Natural, Prosperous Future* (attached hereto as Exhibit 1) at 6.¹ This constancy enabled the

14 Greenland and Antarctic ice sheets to remain in near mass balance, sea levels to be relatively

15 stable, species to diversify, and civilization to develop.

16 Largely due to the burning of fossil fuels, the atmospheric CO₂ concentration has climbed

17 sharply in recent decades – from 316ppm in 1959 to 390ppm in 2010.² In that period, US CO₂

18 emissions more than doubled, from 2.83 to 5.67 billion metric tons.³ The CO₂ concentration is

19 now to a level not seen on Earth for at least 3 million years. Exhibit 1 at 6. The CO₂ increment

20 functions as an added blanket on the planet, reducing the amount of heat that would otherwise be

21 re-radiated to space and throwing the planet into energy imbalance. In response, Earth has

22 warmed by approximately 0.8°C over the last century, likely exceeding the prior Holocene peak.

23

24 ¹ *See also*, James Hansen and Makiko Sato, *Paleoclimate Implications for Human-Made Climate Change* 8-14

25 (2011).

26 ² Mauna Loa CO₂ annual mean data from <http://www.esrl.noaa.gov/gmd/ccgg/trends/>.

27 ³ Carbon Dioxide Information Analysis Center (CDIAC), *National CO₂ Emissions from Fossil-*

28 *Fuel Burning, Cement Manufacture, and Gas Flaring: 1751-2008*, <http://cdiac.ornl.gov/ftp/trends/emissions/usa.dat>. The text of this amicus brief here provides the data in units of CO₂ by utilizing the CDIAC’s carbon-to-CO₂ conversion factor of 3.667.

1 *Exhibit 1* at 7-8. The already apparent impact of this warming is reviewed in the next section.
2 Due to Earth's thermal inertia, a similar or greater amount of additional 2.0°C warming is "in the
3 pipeline" before Earth reaches energy balance at the present level of atmospheric CO₂
4 concentration.⁴

5 Avoidance of climate tipping points and subsequent points of no return⁵ requires effective
6 action to return the atmospheric CO₂ concentration to approximately 350ppm by the end of the
7 century. *Exhibit 1* at 8. This would allow additional heat radiation to escape to space so as to
8 restore the planet's energy balance without additional prolonged global warming. *Id.* Such action
9 could stabilize Earth's climate system and mitigate human suffering, but further delay may doom
10 this prospect.

11 The relevant status quo with respect to the present litigation, therefore, is an atmosphere
12 whose composition of greenhouse gases ensures a relatively stable climate system conducive to
13 the survival and well being of humanity and nature. This requires, then, action to restore the
14 atmospheric CO₂ concentration to no more than 350ppm. In that we have currently overshot this
15 safe atmospheric concentration level, as discussed *infra*, failure to act with all deliberate speed in
16 the face of the clear scientific evidence of the danger⁶ functionally becomes a decision to
17 eliminate the option of preserving a habitable climate system.

18
19 **II. GLOBAL WARMING HAS ALREADY REACHED THE DANGEROUS LEVEL**
20 **AND, WITHOUT EFFECTIVE ACTION, WILL PRODUCE CATASTROPHIC**
21 **AND IRRETRIEVABLE LOSSES.**

22 Global climate change does not present merely "the possibility of some remote future
23 injury." Def. Opp'n to Pl. Motion for Prelim. Inj at 9. Instead, it is a phenomenon that is already
24 undermining human and natural systems, causing loss of life, and pressing species to extinction.

25 ⁴ Hansen et al, Target Atmospheric CO₂: Where Should Humanity Aim?, hereinafter referred to
as "Target CO₂," 225, The Open Atmospheric Science Journal (2008).

26 ⁵ *Id.*

27 ⁶ J. Hansen et al., Dangerous human-made interference with climate, Atmos. Chem. Phys., 7,
2287, 2308 (2007)

1 Unless arrested by effective action, climate change will produce calamitous consequences for
 2 humanity and nature alike, as tipping points are reached and points of no return are crossed.⁷
 3 Present and future impacts are addressed in turn.

4 (a) Present Impacts

5 While, as noted, global warming to date measures 0.8°C above the 1880-1920 period,⁸ it
 6 has already led to a 40 percent reduction and an accelerating downward trend in summer Arctic
 7 sea ice cover, and an even faster decline in its thickness. *Exhibit 1* at 4. Continental ice sheets of
 8 Greenland and Antarctica have begun to shed ice at a rate of several hundred cubic kilometers
 9 per year. *Id.* In the past decade, sea level increased about 3cm—a rate of about one foot per
 10 century, and nearly twice as fast as the rate of increase during the preceding century.⁹ This rise
 11 has resulted in losses of coastal wetland areas and greater levels of damage from coastal
 12 flooding.¹⁰ For example, in the United States, increased sea level has led to the loss of 1900
 13 square miles of coastal wetland in Louisiana, which in turn exacerbates the area’s vulnerability
 14 to storm surges like Hurricane Katrina.¹¹ Mountain glaciers, the source of fresh water to major
 15 world rivers during the dry season, are receding rapidly all around the world. *Exhibit 1* at 4. In
 16 1850, Glacier National Park in Montana had 150 glaciers measuring larger than twenty-five
 17 acres—today, it has just twenty-five.¹²

18
 19
 20 ⁷ Hansen, et al define “the tipping level [as] the global climate forcing that, if long maintained,
 21 gives rise to a specific consequence [and] the point of no return [as] a climate state beyond which
 22 the consequence is inevitable, even if climate forcings are reduced. Target CO₂ at 225.

23 ⁸ The 1880-1920 period is the earliest time at which instrumental data allows accurate
 24 specification of global temperature, and the temperature in that period is estimated to be close to
 25 pre-industrial temperature averaged over several centuries.

26 ⁹ Decl. James Hansen at ¶ 40, 2006 WL 4761053 (D. Vt. 2006).

27 ¹⁰ INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE, 2007: IMPACTS, ADAPTATION, AND
 28 VULNERABILITY, Table 4.1 (hereinafter “IPCC Working Group II”).

 Melillo, T.C. Peterson (eds.), Cambridge Univ. Press.

¹² Brief of Amici Curiae Climate Scientists James Hansen et al., *Chamber of Commerce of the
 United States v. EPA*, 2010 WL ___ (citing to U.S. Geological Survey, *Melting Glaciers Signal
 Change in National Parks*, <http://www.nwrc.usgs.gov/world/content/land5.html>).

1 Tropospheric water vapor and heavy precipitation events have increased. Droughts are
2 more common, especially in the tropics and subtropics. *Exhibit 1* at 4. Coral reef ecosystems are
3 being impacted by a combination of ocean warming and acidification from rising atmospheric
4 CO₂, resulting in a 1-2% per year decline in geographic extent. *Exhibit 1* at 4. World health
5 experts have concluded with "very high confidence" that climate change already contributes to
6 the global burden of disease and premature death with altered distribution of some infectious
7 disease vectors.¹³ Subtropical climate belts have expanded, contributing to more intense
8 droughts, summer heat waves, and devastating wildfires in the southern United States, the
9 Mediterranean and Middle East regions, and Australia. *Exhibit 1* at 4. Mega-heat waves have
10 become noticeably more frequent, including the 2010 heat wave in Moscow and in Texas in
11 2011. *Exhibit 1* at 4. It is nearly certain that such "outlier" heat events would not have occurred
12 in the absence of global warming.¹⁴

13 (b) Future effects

14 Scientific prediction of long-term impacts from climate change is imprecise in part
15 because of uncertainty about the relative speed with which amplifying feedbacks, including
16 disintegration of Earth's major ice sheets, will occur. *Exhibit 1* at 13. Citing the Paleoclimate
17 record, Dr. Hansen and colleagues noted the following most recently:

18 Precise consequences of continuing [business as usual] emissions for
19 several decades are difficult to define, because Earth has never experienced such a
20 large rapid increase of climate forcings as would occur with burning of most
21 fossil fuels this century. The closest analogy in Earth's history is probably the
22 PETM (Paleocene-Eocene Thermal Maximum) in which rapid global warming of
23 at least 5°C occurred. The PETM warming spike occurred in conjunction with
24 injection of 3000-5000 GtC of carbon into the surface climate system during two
25 1-2 thousand year intervals separated by several thousand years. It is often
26 assumed that the carbon originated from melting of methane hydrates, because of
27 the absence of other known sources of that magnitude. PETM occurred during a
28 10-million year period of slow global warming, and thus methane release might
have been a feedback magnifying that warming.

The PETM witnessed extinction of about half of small shelled deep ocean

26 ¹³ IPCC Working Group II.

27 ¹⁴ J. Hansen, M. Sato, R. Ruedy, Climate Variability and Climate Change: The New Climate
28 Dice, Nov. 10, 2011.

1 animals that serve as a biological indicator for ocean life in general, but, unlike
2 several other large warming events in Earth's history, there was little extinction of
3 land plants and animals. An important point is that the magnitude of the PETM
4 carbon injection and warming is comparable to what will occur if humanity burns
5 most of the fossil fuels, but the human-made warming is occurring 10-100 times
6 faster. The ability of life on Earth today to sustain a climate shock comparable to
7 the PETM but occurring 10-100 times faster is highly problematic. Climate zones
8 would be shifting much faster than species have ever faced. Thus if humanity
9 burns most of the fossil fuels, Earth, and all species residing on it, will be pushed
10 into uncharted climate change territory.

11 *Exhibit 1* at 13 (internal citations omitted).

12 Based on measurements of observed climate change, computer simulations of the climate
13 system's responses to additional CO₂ emissions, as well as information from the paleoclimate
14 record, Dr. Hansen and others have concluded that continued burning over several decades of
15 fossil fuels renders multi-meter sea level rise "practically certain," and create cause "millions of
16 global warming refugees from highly populated low-lying areas . . . throwing existing global
17 demographics into chaos." *Exhibit 1* at 14 (internal citations omitted).

18 These researchers note, as well, that acidification stemming from ocean uptake of a
19 portion of increased atmospheric CO₂ is expected to increasingly disrupt coral reef ecosystem
20 health, with potentially devastating impacts to certain nations and communities. *Exhibit 1* at 16.
21 Hansen and others warn of receding mountain glaciers "with effects on seasonal freshwater
22 availability of major rivers," *Exhibit 1* at 4, illustrating that present atmospheric CO₂ levels are
23 "already a threat for future fresh water security." *Id.* at 16.

24 Increased concentration of CO₂ and associated increased global temperatures will deepen
25 impacts on human health, with children being especially vulnerable. *Exhibit 1* at 16. Climate
26 threats to health move through various pathways, especially by placing additional stress on the
27 availability of food, clean air, and clean water. *Exhibit 1* at 16 (*citing to* Bernstein and Myers,
28 *Climate Change and Children's Health*, Current Opin. Pediatrics, 23, 221-226 (2011)). Other
principle climate-related impacts on human health include heat waves, asthma and allergies,
infectious disease spread, drought, pests and disease spread across taxa: forests, crops and marine
life, and winter weather anomalies. *Exhibit 1* at 18 (Table 1).

1 As noted *supra*, climate zones are already shifting at rates that exceed natural rates of
 2 change; this trend will continue as long as the planet is out of energy balance, a conclusion
 3 “based on comparison of the observed trend with inter-decadal variability in climate
 4 simulations.”¹⁵ Dr. Hansen and others note that “as the shift of climate zones becomes
 5 comparable to the range of some species, the less mobile species will be driven to extinction.”
 6 *Exhibit 1* at 15. In 2007, the Intergovernmental Panel on Climate Change (IPCC) summarized
 7 studies estimating species extinctions from additional global warming and estimated¹⁶ that for
 8 global warming of 1.6°C or more, relative to pre-industrial levels, 9-31 percent of species will be
 9 driven to extinction, while with global warming of 2.9°C, an estimated 21-52 percent of species
 10 will be driven to extinction.¹⁷

11
 12 III. ACTION TO PHASE OUT CO₂ EMISSIONS IS URGENTLY REQUIRED, WHILE
 13 DELAY VIRTUALLY ENSURES CALAMITY.

14 The 2007 consensus statement by the IPCC, summarizing research through 2005, indicated
 15 that human-induced warming of Earth of approximately 2°C constituted dangerous climate
 16 change. From that, however, no conclusion logically could be drawn as to the danger inherent in
 17 lower levels of global warming.

18 Research by Dr. Hansen and others to assess this question has been spurred on by the
 19 realization, as described *supra*, that large climate impacts have commenced already, even though
 20 Earth’s lagged temperature response to the recent climb in atmospheric CO₂ is only 0.75°C
 21 above preindustrial levels. Hansen et al estimate that this warming is already at least 0.25°C
 22 above the prior Holocene maximum. *Exhibit 1* at 5. Empirical research showing an ongoing and

23
 24 ¹⁵ Hansen, J., M. Sato, R. Ruedy, *et al.*, 2007b: Dangerous human-made interference with
 climate: a GISS modelE study, *Atmos. Chem. & Phys.*, 7, 2287-2312.

25 ¹⁶ IPCC Working Group II.

26 ¹⁷ Hansen et al note that “mass extinctions have occurred in conjunction with rapid climate
 27 change during Earth's long history. While new species evolved over hundreds of thousands and
 millions of years, such time scales are almost beyond human comprehension. Accordingly, if we
 28 drive many species to extinction we will leave a more desolate planet for our children,
 grandchildren, and as many generations as we can imagine.” *Exhibit 1* at 15.

1 accelerating mass loss of the Greenland and West Antarctic ice sheets, which began within the
2 last few decades, provides strong confirmation that today's global temperature has reached a
3 level higher than prior Holocene temperatures. *Id.*

4 Accordingly, the best available current science establishes that today's global temperature is
5 already close to or into the "dangerous zone." *Exhibit 1* at 106. Because the recently-observed
6 climate effects with respect to the ice sheets are still relatively small compared to total ice sheet
7 mass, these feedbacks may not be a major factor if maximum global warming overshoot of ~1°C
8 occurs only briefly and then recedes. *Exhibit 1* at 10-12.

9 Action therefore must be undertaken to restore the atmosphere's safe level of CO₂
10 concentration to 350ppm, so as to avert any avoidable additional warming that may drive the
11 climate system past tipping points "that assure transition to a very different planet," *Id.* at 12, and
12 keep the period of overshoot to an absolute minimum.

13 Two underlying reasons that such action must be undertaken without further delay is
14 indicated in Amicus Hansen's most recent research, summarized here, and illustrated in Fig. 1
15 *infra*. First, a substantial share of any additional infusion of CO₂ lasts in the atmosphere for
16 centuries (and while there, continuously acts to further heat the planet). Accordingly, Earth's
17 temperature response to the "radiative forcing" effect of the higher atmospheric CO₂
18 concentration is a function not only of recent emissions, but the persisting share of prior
19 emissions. Second, as a consequence of the long-lived nature of CO₂ and the fact that human-
20 derived emissions have already cause a substantial overshoot of the long-term safe atmospheric
21 concentration level, any substantial delay in undertaking effective action – even if such action
22 compelled a sharp cut-off of emissions – would render it impossible to return the atmospheric
23 CO₂ concentration to 350ppm within this century. Thus, as illustrated in Fig. 1b, if emissions of
24 CO₂ are allowed per business as usual for even two decades longer the concentration of CO₂ in
25 the atmosphere will not return, until the year 2150, to the nominally safe level of 350ppm even if
26
27
28

1 all such emissions were abruptly ceased in the year 2030.¹⁸ In contrast, complete cessation in
 2 2011 would return the atmospheric CO₂ concentration to 350ppm by mid-century. *Exhibit 1* at
 3 9.

4
 5
 6
 7
 8
 9
 10
 11
 12
 13 Figure 1. (a) Decay of instantaneous (pulse) injection and extraction of atmospheric CO₂, (b)
 14 CO₂ amount if fossil fuel emissions are suddenly terminated at the end of 2010, 2030, 2050.
 15 (Hansen et al., *The Case for Young People and Nature: A Path to a Health, Natural, Prosperous*
 16 *Future.*)

17 An abrupt cessation of all CO₂, whether in 2011 or 2030, is unrealistic, in part because
 18 industry, other business, and consumers alike need time to retool and reinvest in emission-free
 19 options to fossil fuels. Accordingly, Hansen et al have proposed a glide path to secure an
 20 atmosphere whose CO₂ concentration is no higher than 350ppm. Their plan requires emission
 21 reductions of 6 percent annually, coupled with a program of reforestation. *Exhibit 1* at 10. This
 22 will achieve the goal of restoring the atmosphere to approximately 350ppm if the plan is
 23 commenced without delay, and then adhered to. However, consistent with the abrupt phase out
 24 scenarios discussed in the prior paragraph *supra*, if the 6 percent annual emission reductions are
 25 delayed until 2030, then the global temperature will remain above 1°C higher than preindustrial

26 ¹⁸ *Exhibit 1* at 9. Further, were the emission cessation to commence only after 40 years, Dr.
 27 Hansen estimates that the atmosphere would not return to 350ppm CO₂ for nearly a 1000 years.
 28 *Id.*

1 levels for nearly 300 years. It would be “highly unlikely,” that the planet’s major ice sheets
2 would remain “stable at their present size with such long-lasting warmth.” *Exhibit 1* at 12-13.

3 Considered in another way, the required rate of emissions reduction would have been
4 about 3.5% per year if reductions had started in 2005, while the required rate of reduction, if
5 commenced in 2020, will be approximately 15% per year. *Id.* at 6. This illustrates, again, that
6 “the dominant factor, by far, is the date at which fossil fuel emission phase-out begins.” *Id.* at 11.

7 The present danger and impending calamities presented by continued CO₂ emissions, and
8 the urgent need to get beyond fossil fuels before Earth is altered in fundamental respects –
9 including its ability to sustain civilization – renders it a first-order tragedy that all serious
10 attempts to address the problem in Congress to date either have been still-borne or killed after
11 some debate. Equally tragic, the executive branch, including our current president, has declined
12 to act with any degree of effectiveness to restrict CO₂ and other greenhouse gas emissions from
13 the largest sources – bowing to industry pressure at virtually every turn even though, pursuant to
14 the Supreme Court’s leading global warming decision, *Mass. v. EPA*, 549 U.S. 497 (2007), it
15 retains authority to act. The “absence of effective leadership” is attributable, as Amicus Hansen
16 points out, to the “undue sway of special financial interests on government policies.”¹⁹ In the
17 absence of political leadership, an Order by this Court granting the injunctive relief sought by
18 plaintiffs in this matter may be the best, the last, and, at this late stage, the only real chance to
19 preserve and restore the atmosphere and climate system.

20 CONCLUSION

21 Systematic reductions in CO₂ emissions, for the reasons provided by Dr. Hansen in his work
22 cited throughout this amicus brief, must be undertaken in conjunction with reforestation so as to
23 return the concentration of CO₂ in the atmospheric to a level no higher than 350ppm by the end
24 of the century, if not sooner. Plaintiffs in this matter seek an Order by the Court to require
25 Defendants to submit a “Climate Recovery Plan” by next March whose key features, if followed,

26 ¹⁹ *Exhibit 1* at 10 (citing to Oreskes, N.; Conway, E.M., 2010: Merchants of Doubt: How a
27 Handful of Scientists Obscured the Truth on Issues from Tobacco Smoke to Global Warming.
Bloomsbury Press, 355 pp. merchantsofdoubt.org.).

1 will restore the atmosphere and preserve a habitable climate system. This brief has established
2 that such action is urgently required. In particular, the failure to commence CO₂ reductions
3 without further delay, and to undertake other measures consistent with the prescription
4 developed by Dr. Hansen and others, and advanced in these proceedings by Plaintiffs, would
5 consign our children and their progeny to a very different planet, one far less conducive to their
6 survival.

7 Respectfully submitted this 14th day of November, 2011.
