Helical screw anchors to be used with the Carapax Helix Drilling Rig. We supply both standard of the shelf screw anchors or custom made units – all depending on the bottom condition at your specific farming site. A typical anchor for a muddy bottom has a 50x50 mm shank size, is between 3-6 meters long and has a disc diameter or 600-1000 mm. The shank and disc are bolted together at site in order to transport economically. The anchor head has the ability to swivel.
