

# ISG Intelligence Systems Group

*ISG is a Service Disabled Veteran-Owned Small Business (SDVOSB) providing specialized applications-to-cloud migration services; cyber security software products; and other Information Technology and engineering consulting services for US Government, US Intelligence Community, Academia, & Commercial Industry clients. We are passionate about innovation and being excellent in the services we provide, the products we create, the people we hire, and the clients we assist*

- *ISG specializes in cybersecurity consulting and data migration projects including strategic architectural planning and review; accreditation; and detailed CBA analyses of cloud service providers. We guide clients through the cloud migration process in the shortest times feasible and maintain numerous industry certifications (CISSP; CISM; CISA; CCSK; PMP; SA)*
- *ISG is a company of strategic thought leaders, visionaries, and experts in execution; we work with our clients to solve problems at all levels to improve the effectiveness of their people, mission outcomes, and ROI*
- *ISG is a SAM-registered, cVe-certified SDVOSB with an active TS/SCI Facility Clearance and access to a deep bench of subject matter experts, partner companies, and contract vehicles*
- *Summary of ISG Consulting Services*

*Applications Development  
Architecture Design  
Cloud Migration & Platform Services  
Cyber Security Software  
Data Center Consolidation  
Database Maintenance*

*Enterprise Data Management  
Market Analyses  
Project Management  
Social Engineering & Crowdsourcing  
Systems Engineering & Integration  
Training*

# ISG Software Capabilities Portfolio

## *DBAs – Automate daily tasks, projects and deployments*

Combine automates data collection, aggregation, and storage to one or more output databases and deploys custom admin projects, executes scripts, and runs distributed queries on all databases and servers with one click.

## *GRAPHUS - AI Powered Cloud App Security*

Graphus provides industry-leading social engineering detection capabilities using cloud-based cyber security to detect sophisticated attacks that even bypass G Suite's world-class security. This patented technology uses graph theory, big data algorithms, and machine learning to learn about the trusted relationships and user behaviors unique to organizations. Interactions and user actions are evaluated against this profile to detect social engineering attacks and suspicious activities.

## *Advanced Perimeter Defense*

PacketViper is advanced perimeter defense and automated deception software. PacketViper software operates in-line, deceiving attackers and reducing traffic volume in ways that Firewalls, IDS & IPS are not designed to address while at the same time making them all work better. PacketViper uses a unique array of sensors, redirection techniques and triggers to create a dynamic and deceptive *Virtual Minefield Zone* (VMZ)<sup>TM</sup>. With PacketViper in place attackers won't see the same perimeter twice.

QNXIS

## *LIINX Mobile App – Collaboration with Emergency Notification and Accountability*

LIINX provides a flexible, bi-directional mobile app that enables organizations to remain more simply connected with their personnel. LIINX leverages the power of mobility and social media to collaborate and to communicate more precisely using content most relevant to their industries. It features a mass emergency notification and accountability system called "RUOK?" (Are You Okay?). "RUOK?" gives administrators and first responders the ability to alert people via the LIINX app about volatile situations and conditions. First responders can send multi-mode mass communication alerts via text, email, and push notifications to LIINX community users to let them know what is happening and to provide them with instructions about what to do. A customized dashboard display gives first responders the ability to assess users, locate them via GPS, and then provides aid by contacting them directly via email, voice, or other data options.
