Mapping For Future Growth
A workshop for resource managers, local officials, planners, developers, community members and others interested in collaborative planning and public participation for community resiliency. CHARM helps decision makers gather input and educate the public about the “what-ifs” of long term growth and planning. Workshop participants collaborate over a live table-top interface and use local mapping data to plan hypothetical growth scenarios for their community. Real time feedback allows participants to see the consequences of their planning decisions. The planning support tool encourages collaborative problem solving and no GIS experience is needed to participate in a CHARM workshop.
Community Health and Resource Management Model

A low cost “what-if” scenario mapping tool that brings together planners, developers, resource managers, local officials, agency staff, business owners and community members to actively participate in community planning activities.
