Program Descriptions:

**Living Things and Their Habitats - What Lives Here?**

Activities in this program support students in obtaining, evaluating and communicating information about patterns of living things in and around the Logan River. Students will figure out what lives in this ecosystem by looking for evidence and by using a simple field guide. They will deepen their understanding of evidence, both the evidence organisms leave behind and evidence in general.

**Snowshoeing**

Join us for this fun and popular winter activity! Students will learn how to safely snowshoe in a group while looking for evidence of organisms in the winter landscape.

**Changes in the Earth’s Surface**

Logan Canyon provides an excellent location for students to explore and construct an explanation about changes in Earth’s surface. Together we’ll learn about the fast changes that occurred here as well as the slow changes that continue to shape The Canyon.

*This program may also be delivered in your classroom utilizing a powerpoint presentation and rock samples.*
