

Upstream Research™ reports environmental risks and disease rates for neighborhoods and schools across the U.S

Seattle, Washington – December 2, 2016 – Upstream Reports™ may change how we think about where we live, work and play.

Until now, there has been no easy way to understand what is in the air we breathe, the water we drink and the soil under our feet. Upstream Research™, a disruptive health analytics company in Bainbridge, Washington, is about to change that.

“For too long information about the environmental quality and overall health of an area has been scattered across numerous agencies and organizations,” says Nick Bedbury, Upstream Research CEO. “We can now combine terabytes of environmental risk data, often at a neighborhood level, alongside disease rates and health outcomes. It’s big data for the greater good.”

It has taken Upstream more than a year to bring this kind of data forward and make it easy for anyone to understand. An Upstream Report can be downloaded from upstreamreports.com in seconds for any location in the US. The first Report is free with additional reports costing \$5. \$1 from each paid Report goes to support communities at acute health risk and cancer research.

Given the implications of the incoming administration to limit, if not eliminate, the EPA the timing for Upstream could not happen at a better time.

“Our mission is simple: To move quickly to inform and empower individuals and organizations to make more informed decisions about where they choose to live, work and play. Everyone should have that right, that power.”

“We feel strongly about providing this information direct to the public and accelerating the work of non profits and disease researchers where environmental risks are not well understood,” Bedbury said.

“Our goal is to help prevent disease.” says Bedbury. “Today, we spend 50 times more treating disease than we do preventing it. Preventing disease will require going upstream, to its headwaters and identifying sources, be they behavioral, genetic or environmental.”
