Hospitals are making the right decisions when it comes to preventing infections, but there is one area that is often overlooked. There is an *Invisible Threat* that travels throughout facilities, impacts patient care, employee retention and even creates financial risk.

Options to combat this threat were limited; before **VIDASHIELD™**.
Accepted protocols to address surface contamination are based on episodic cleaning and while hospitals are very
diligent in their disinfection procedures, the time between
and the quality of cleaning
affects the risk.

VIDASHIELD
effectively fills the gap created when terminal cleaning isn’t an option. Protect patients and staff from
The Invisible Threat posed by episodic cleaning.

The American Journal of Infection Control recently cited a study that detailed how airborne dispersion of
pathogens can be rapid, widespread and difficult to prevent.\(^1\) Hospital air can also be a potential route for
transmission of pathogenic aerosols like Methicillin resistant Staphylococcus aureus and C. difficile.\(^2,3\)

JOIN LEADING HOSPITALS BATTLING THE INVISIBLE THREAT

Leading hospitals are combatting contaminated air
with a proven, patented UV-C air purification
system uniquely designed inside a lighting fixture
called VIDASHIELD.

Housed in a shielded UV chamber in the ceiling
and ideally located for maximum effectiveness,
VIDASHIELD continuously reduces harmful
bacteria and fungi from treated air while improving
air quality and minimizing odors.

FILL THE GAP WITH CONTINUOUS CLEANING

Accepted protocols to address continuous cleaning are based on episodic cleaning and while hospitals are very
diligent in their disinfection procedures, the time between and the quality of cleaning affects the risk.
VIDASHIELD effectively fills the gap created when terminal cleaning isn’t an option. Protect patients and staff from
The Invisible Threat posed by episodic cleaning.
