3/25/24 Charlie Reese: 7 year boy: Operation went well last night. It was much later than originally expected so we got to Charlie's room about 1am. The fluid they took from his belly when they removed the catheter came back positive for infection fairly quickly. They are giving broad spectrum antibiotics until they know more about what bacteria strain was present and then will be able to narrow the treatment. Infectious Disease will be following him and are working up a plan. Seeing those drs gives me a little ptsd but here we are. It's good they have a clear reason for these issues, but also means the shunt was at risk so praying it didn't work its way up into the brain. We won't know for certain for at least 7 days (unless the culture changes in the meantime). From John McElroy
