END NEW HIV INFECTIONS. 
THE TIME IS NOW.

WE HAVE COME SO FAR.
Ryan White services in Oregon are helping to ensure health equity and achieve the triple aim of better health, better care, and lower costs. Effective treatment of HIV can result in viral suppression, meaning that the amount of virus in a person’s body is greatly reduced and their risk of transmitting HIV to their sexual partners is eliminated.¹ Ryan White programs work. Oregon’s surveillance data show that 76% of people living with HIV are virally suppressed. Among PLWH enrolled in Ryan White programs, the proportion who are virally suppressed is between 85%–90%.

BETTER HEALTH
Regular medical care is essential for people living with HIV. People living with HIV enrolled in Ryan White services are more likely to access regular medical care, experience fewer opportunistic infections and have undetectable viral loads.

BETTER CARE
Coordination of care through Ryan White case managers helps reduce duplication of services and prevent gaps in care where people may not be virally suppressed. In Oregon, 85% of people are linked to care within 3 months of diagnosis.

LOWER COST
People living with HIV with well-managed HIV disease avoid costly hospitalizations and treatments for preventable medical conditions. Preventing one new HIV infection saves the healthcare system an estimated $357,498 in lifetime HIV care costs.²

HEALTH EQUITY
HIV-related disparities exist in Oregon, but Ryan White programs help close those gaps, particularly related to viral suppression. Ryan White programs are available to all PLWH who meet the income guidelines, regardless of race, ethnicity, sexual orientation, gender identity, or other characteristics.
