Electoral Integrity Around the World

I: EXECUTIVE SUMMARY

Elections should provide opportunities for citizens to participate in politics and hold leaders to account. When they work well, elections can deepen civic engagement, inform public debate, stimulate party competition, strengthen government responsiveness, and allow the peaceful resolution of political conflict.

The problem is that too often contests fail to achieve these objectives. There is widespread concern in many countries about low or falling turnout, public disaffection, party polarization, and the failure of elections to ensure legitimate outcomes. Electoral malpractices continue to undermine contests around the world, from overt cases of violence and intimidation to disinformation campaigns, cybersecurity threats, barriers to voting, and the underrepresentation of women and minority candidates. To assess global trends, the Perceptions of Electoral Integrity expert survey monitors elections worldwide and regionally, across all stages of the electoral cycle.

This report describes the Perceptions of Electoral Integrity dataset (PEI-7.0). The dataset is drawn from a rolling survey of 3,861 expert assessments of electoral integrity across 337 elections in 166 countries around the world. The cumulative study covers all national presidential and parliamentary elections from July 1, 2012 to December 31, 2018. This annual release adds 53 presidential or parliamentary contests held during 2018. Perceptions of electoral integrity are measured by experts in each country one month after polls close. Experts are asked to assess the quality of national elections on eleven sub-dimensions: electoral laws; electoral procedures; district boundaries; voter registration; party registration; media coverage; campaign finance; voting process; vote count; results; and electoral authorities. These items sum to an overall Electoral Integrity Index scored from 0 to 100. Additional batteries of items are used to monitor specific problems each year. Given widespread concerns about the issue of fake news, online disinformation, and foreign meddling, the 2018 survey focused on issues of campaign media.

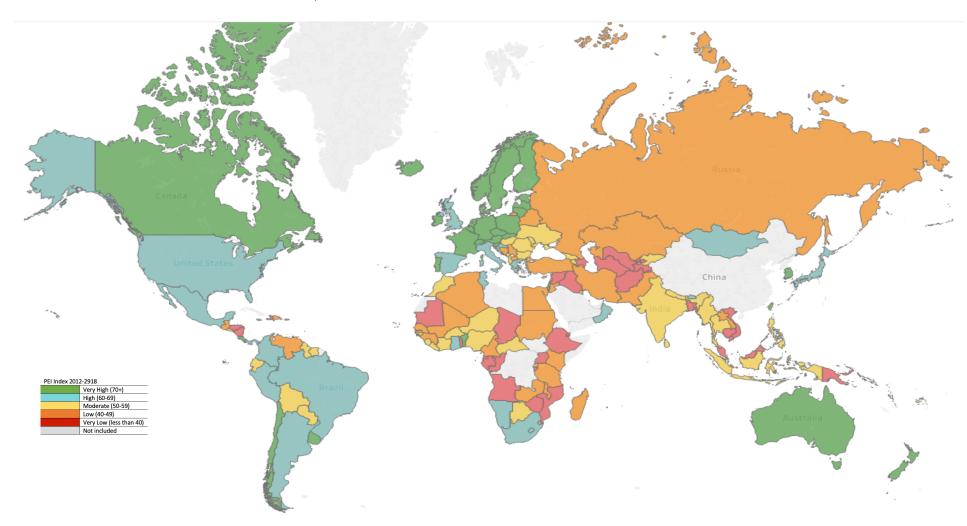

Plan of the report

Part I provides a snapshot of the results. Figure 1 presents the updated global map of electoral integrity, using the PEI Index. The report also lists updated country election scores by global region, as well as across the electoral cycle. Part II examines the quality of campaign media. Part III focuses on three cases in more detail – Italy, Russia and Venezuela. Part IV describes EIP's methods, country coverage, and research design. The final sections list selected publications from the Electoral Integrity Project and further readings.

All electronic data can be downloaded, at the levels of experts, elections, and countries, from http://thedata.harvard.edu/dvn/dv/PEI.

Source: The Perceptions of Electoral Integrity expert survey, country-level (PEI 7.0)

The comparison within each of the regions demonstrates that the **Nordic region** had elections with the highest levels of integrity (over 80), with very positive evaluations of Denmark, Finland, Norway, Sweden and Iceland. This is not surprising; these are all affluent post-industrial societies, consensus democracies, and egalitarian welfare states, which commonly rank highly in many other measures of democratic governance, integrity, and human rights.

They are closely followed in **Western Europe** by Germany and the Netherlands. Many other states in this region also have very high levels of electoral integrity, according to experts, such as France and Ireland. At the same time, it is noteworthy that Greece, the UK, and Malta were evaluated less positively, with PEI scores of 65-66, a full twenty-points less than the world-leader of Denmark. Following a series of problematic contests under President Erdogan, Turkey is ranked as low in integrity.

In the **Americas**, it may be no surprise that Canadian elections are well-rated by experts, but so are contests in middle-income Costa Rica and Uruguay. Latin America shows varied scores, moreover, with the US given an overall rating of 61, lower than any other long-established democracies and affluent societies. Further analysis reveals that the average expert ratings of American elections are significantly pull down by electoral laws, voter registration, and district boundaries issues.² The region also contains the highly problematic cases of Venezuela (discussed in detail later in the report), as well as Honduras, Nicaragua, and Haiti.

Other world regions display a similar varied patter of electoral integrity; thus, in **Central and Eastern Europe**, countries such as Estonia, Lithuania and Slovenia have held a series of free and fair contests since emerging from Communist rule, rated as positively as many equivalent contests in Western Europe. At the same time, several Eurasian autocracies hold elections with numerous serious flaws, exemplified by Tajikistan and Turkmenistan.

Asia-Pacific is equally varied in the quality of its elections, ranging from high integrity in New Zealand, South Korea, Taiwan and Australia in contrast to fundamental weaknesses in elections in Afghanistan, Vietnam and Cambodia.

The **Middle East and North Africa** display elections which show marked contrasts, with Israel and Tunisia rated most highly compared with façade elections held by the Syrian regime. **Sub-Saharan Africa** is also varied, from positive ratings in Cape Verde and Benin (at least before the presidential contest in May 2019) compared with the lowest rating of any elections around the world in Burundi, Equatorial Guinea, and Ethiopia.

The exact reasons why contests are flawed or fail differs from one state to another, but it commonly involves processes of corruption in kleptocratic states ruled by clientelism, contests disrupted by outbreaks of violence and civil conflict, and state repression of opposition forces and fundamental human rights, as well as lack of state capacity in poorer developing societies.³ Understanding the reasons requires breaking down the summary PEI Index scores in far more detail, including by problems occurring at different stages of the election, and also by comparing changes in successive elections in each country.

SCORES ACROSS THE ELECTORAL CYCLE

Source: The Perceptions of Electoral Integrity expert survey, election-level

Overall, the weakest stage of the electoral cycle in many countries are media coverage and campaign finance. But diverse problems are evident in each contest, such as the introduction of more majoritarian electoral laws favoring the government in Hungary, problems of campaign finance in Antigua and Barbuda, and electoral boundaries in Lebanon. The cases of Russia, Italy and Venezuela illustrate the varied problems which can arise, as discussed in more detail in Part III.

Moreover, the quality of free and fair contests is closely related to the type of regime in power. This is only to be expected; electoral integrity is the core defining feature of liberal democracy. Figure 4 illustrates the general patterns. Elections are necessary for liberal democracies -- but they are far from sufficient. Today contests are held in most of the world's electoral autocracies and closed autocracies but with so many flaws that these serve to reinforce control by ruling parties and leaders, rather than facilitating genuine accountability and public choice.

II: CAMPAIGN MEDIA

There are many reasons for growing concern about the quality of the campaign media, including ways in which the integrity of elections has been challenged by both misinformation and disinformation campaigns⁴ and by cybersecurity attacks on official electoral records and party email servers.⁵ Recent attention has been catalyzed by intelligence reports of Russian meddling in the 2016 US election.⁶ But the problem is not confined to America, as foreign interference has been reported in the Brexit referenda campaign and in Europe.⁷

Given these concerns, the European Commission published a high-level expert study looking into 'disinformation', defined to include all forms of false, inaccurate, or misleading information designed, presented and promoted to intentionally cause public harm or for profit.⁸ Other issues of long-standing concern for the quality of campaign communications includes the desirability of balance and pluralistic diversity in media election reporting, avoiding highly polarized partisanship.⁹ Additional problems arise from the creation and dissemination online of illegal content, notably defamation, hate speech, and incitement to violence, as well as the spread of conspiracy theories online. The erosion of public confidence in the news media, fueled by populist claims of 'fake news', pose further challenges.

The fake news mantra fuels a 'post-truth' world, with populists denying the enlightenment idea that there can be such a thing as objective knowledge, scientific evidence, or impartial journalism. Declining use of legacy news media, and the rise of social bubbles and echo chambers in online media, reinforce dogmatism fueled by ideology not fact. Where news or social media provide repeated distortions impacting citizens' perceptions of events, these can give rise to deep-seated misinformed beliefs and cause significant harm. Attacks on journalistic elites as 'enemies of the people' are part and parcel of authoritarian populist rhetoric, with a crackdown on mainstream media by leaders such as the Philippines' Rodrigo Duterte, Hungary's Viktor Mihály Orbán and Turkey's Recep Erdoğan. At a joint press conference in Manila, when Duterte called the media 'spies', Trump laughed. 12

How extensive are each of these problems? Are some problems confined to a few well-known cases, including the US, or are they found around the world? Despite widespread concern, and regular annual indices concerning freedom of the press and the internet around the world, little systematic evidence has been gathered to monitor the integrity of campaign media in elections across countries and varied types of regimes. To monitor the extent of the risks, the PEI expert survey added several items from a new rotating annual battery designed to capture several of these issues, including "fake news", partisan media, foreign meddling, and media monitoring. The results in Figure 5 illustrate some of the patterns showing that countries which generally perform poorly in elections overall, such as Egypt, Djibouti, and Venezuela, commonly have the most problems in media campaigns as well. But it is worth highlighting that some other specific weaknesses also emerge, such as partisan reporting in Montenegro, poor journalistic standards following government repression of the press in Hungary, and fake news on social media in Costa Rica and the Czech Republic. The silver lining, however, is that few elections were reported to experience successful cyberattacks on official voting records.

III: CASE-STUDIES OF 2018 ELECTIONS: ITALY, RUSSIA AND VENEZUELA

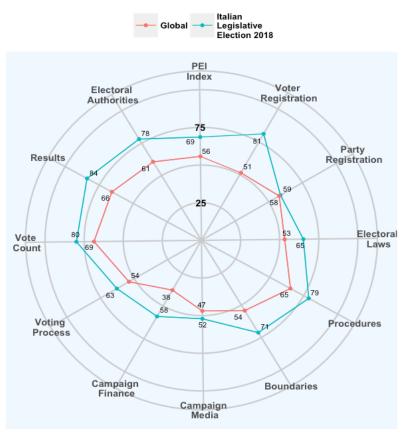

The comparison of a range of important elections in all regions of the world demonstrates that the quality varies substantially, due to structural, institutional and political factors.¹³

At the top end of the electoral integrity scale were Presidential elections last year in Finland (PEI Index=84) and Costa Rica (PEI Index=77), showcasing best practices with few flaws. At the other end of the scale, however, in Iraq (PEI Index=32), a turbulent contest saw ballots subject to a recount set ablaze, exacerbating tensions amid widespread electoral malpractices. In Lebanon (PEI Index=42), the first national elections held since 2009 marked a vital step forward, but the contest was marred by endemic corruption, clientelism, and interference from outside forces. A shock victory for the opposition in Malaysia (PEI Index=33) was remarkable in light of the odds stacked against them by systemic gerrymandering and malpractices favoring the incumbent. Some selected cases illustrate practices in more detail.

Italy

Italy held general elections on the 4th of March 2018, after a period of political turbulence following the resignation of Prime Minister Matteo Renzi, leader of the center-left Party Democratic (PD). Members of Italy's bicameral Parliament serve 5-year terms, with the president of the parliamentary republic serving as head of state in a seven year term. ¹⁶ The passage of the "Rosatellum" electoral law of 2017 saw the adoption of a 'parallel'voting system. ¹⁷ The lower house has 630 members, with first-past-the-post used for 232 seats and the remainder determined by closed-list proportional representation with regional quotas. ¹⁸ The election was held against the backdrop of the country's declining economic conditions, which exacerbated tensions associated with the migrant crisis, driving dissatisfaction with the establishment and the European Union. ¹⁹

FIGURE 6. ITALY'S PERFORMANCE ON THE PEI SUBDIMENSIONS

Source: The Perceptions of Electoral Integrity expert survey, election-level

The campaign saw sporadic outbreaks of xenophobia and violence, including a far right activist shooting at and injuring African migrants.²⁰ OSCE observers lamented the hollowing out of moderate discourse amid a rhetorical arms race centered on concerns about immigration and integration. In particular, the OSCE raised concerns about "discriminatory stereotyping and intolerant rhetoric targeting immigrants, including on social media."²¹ Voter turnout, down to

69% in the lower house (-14%), suggests that these conditions may have taken a toll on citizen engagement.²²

Renzi's centre-left coalition led by PD saw a dramatic decline in its seat share, maintaining only 122 seats in the Chamber of Deputies and losing 227. The primary beneficiaries were Matteo Salvini's centre-right coalition, which added 138 members, for a total of 265. The populist Five Star Movement gained 114 seats, for a total of 227. After extensive negotiations, the Five Star Movement and the League formed a governing coalition headed by Prime Minister Giuseppe Conte. The coalition government represents a populist victory for anti-establishment, anti-immigration, and Eurosceptic forces.

Italy's 2018 elections performed relatively poorly on the PEI Index compared with other states in Northern and Western Europe, with an overall score of 69, similar to an index of 67 in the 2013 elections. Despite this, the country has seen strong gains on the reformed electoral laws (+21) and campaign finance (+9) dimensions from the 2013 legislative elections.

As with most countries, Italy continues to have moderate scores on campaign media, rating at 52/100. This is consistent with the country's relatively high levels of fake news (Figure 5). Mistrust of the news media followed years of delegitimization by political elites, including former Prime Minister and media mogul Silvio Berlusconi. The digital turn in Italian politics, central to the success of the Five Star Movement, created fertile conditions for misinformation to thrive, exacerbated by the weakness of the independence of the media oversight body. Despite high quality elections overall, politicization of media regulation, lack of media diversity, and harsh libel laws may undermine the ability of Italian citizens' to make informed political choices, particularly as the problems associated with fake news and misinformation grow more severe.

Russia

The reelection of President Putin in the Russian election on the 18th of March 2018 was in no doubt flawed, the vote was seen by some analysts as "a sort of celebration of the post-Crimea majority's identity". ²⁵

The Kremlin's proactive measures to prevent the existence of any genuine consolidated opposition, the absence of a free press, and loyalist security forces, serve to preserve the status quo.²⁶ Russian elections are characterized by widespread voter intimidation and the jailing of political opponents, and independent journalists have become common targets of state repression, with state media ensuring the delivery of propaganda.

OSCE observers characterized the election as having been conducted in "an overly controlled legal and political environment", in which restrictions on fundamental freedoms of expression and candidate registration and "extensive and uncritical coverage of the incumbent" skewed the playing field.²⁷

OSCE observations are confirmed by the relatively poor performance of Russia's 2018 election on the PEI Index, with particularly severe issues identified on the electoral laws and campaign media (Figure 7). Yet, improvements on the formal aspects of the presidential election, the electoral procedures, and the vote count saw a slightly stronger performance than we reported in the 2016 Duma elections.

FIGURE 7. RUSSIA'S PERFORMANCE ON THE PEI SUBDIMENSIONS

Source: The Perceptions of Electoral Integrity expert survey, election-level

Venezuela

The Venezuelan Presidential election held on the 20th May 2018 was widely denounced as a "farce" and a "show election", with the Organization of American States stating that in the electoral process "the dictator Maduro tried – without success – to give a democratic veneer to his totalitarian regime". The legitimacy of the contest, which Maduro won easily with more than two-thirds of the valid vote total, was further undermined by an opposition boycott and record low turnout. Incumbent President Maduro inherited and expanded upon Chavez's mechanisms of political control, which empowered him to suppress political opposition and critical press. In 2017, Maduro dissolved the National Assembly, after a coalition of opposing parties formed a majority after the 2015 parliamentary election for the first time in nearly two decades. Despite a formal ban on public protests, runaway inflation and shortages of basic goods brought protestors into the streets again during the 2018 elections.

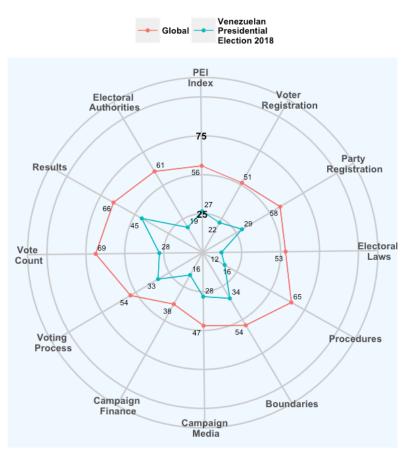

The elections were widely condemned, with G7 leaders making a joint statement, "united in rejecting the electoral process leading to the May 20, 2018, Presidential election in Venezuela"

for "failing to meet accepted international standards".³³ The High Representative of the EU similarly released a statement condemning the elections for failing to comply with minimum international standards of political pluralism, transparency, and the upholding of the rule of law,³⁴ while Members of the European Parliament called for "fresh presidential elections in accordance with internationally recognised democratic standards".³⁵

As Figure 8 shows, Venezuela performs extremely poorly on electoral integrity throughout the various stages of the electoral cycle, well below the global average on all dimensions. Venezuela's PEI Index score has halved across its past three Presidential elections, from 54 in 2012 to 39 in 2013 to 27 in the most recent contest in 2018. This decline has been driven in large part due to major declines on the electoral laws (-35), electoral procedures (-45), party registration (38), and electoral authorities (-30) subdimensions. These results correspond with downgrades from other ratings agencies, including Freedom House, which now scores Venezuela as "Not Free", substantially on the basis of the deterioration of its democratic institutions.³⁶

FIGURE 8. VENEZUELA'S PERFORMANCE ON THE PEI SUBDIMENSIONS

Source: The Perceptions of Electoral Integrity expert survey, election-level

PERFORMANCE SCORES WORLDWIDE

Therefore, overall, elections are now held in almost all countries around the world but how far they meet international standards of electoral integrity varies substantially and elections, and, by themselves, are clearly insufficient for liberal democracy unless many other checks and balances prove effective in providing opportunities for government accountability, inclusive participation, and the protection of human rights in each state.

For the broadest comparison, Figure 8 lists the summary scores for PEI across the 11 dimensions for all elections covered from 2012-2018.

IV: TECHNICAL APPENDIX: INDICATORS, COVERAGE AND METHODS

Global Coverage: The PEI survey of electoral integrity covers independent nation-states around the world which have held direct (popular) elections for the national parliament or presidential elections. The criteria for inclusion are listed below. The study covers 336 elections in 166 nations from 1 July 2012 to 31 Dec 2018.

TABLE A1: COUNTRY COVERAGE

	#	Definition and source
Total number of independent nation-states	194	Membership of the United Nations (plus Taiwan)
Excluded categories		
Micro-states	11	Population less than 100,000: Andorra, Dominica, Liechtenstein, Marshall Islands, Monaco, Nauru, Palau, San Marino, Seychelles, St. Kitts and Nevis, and Tuvalu.
Without de jure direct (popular) elections for the lower house of the national legislature	5	Brunei Darussalam, China, Qatar, UAE, and Saudi Arabia
State has constitutional provisions for direct (popular) elections for the lower house of the national legislature, but none have been held since independence or within the last 30 years (de facto).	3	Eritrea, Somalia, and South Sudan
State has direct elections for the lower house of the national legislature but only candidates for the ruling party have ballot access, excluding independents and candidates for any other party.	2	North Korea, Cuba
Not yet included in the survey	8	DRC, Kiribati, Libya, Saint Lucia, Saint Vincent and the Grenadines, Trinidad and Tobago, Yemen. ³⁷
Covered to date in the PEI 7.0 dataset	166	95% of all the subtotal of nation-states

Respondents: The project identified around forty experts per election, defined as a political scientist (or other social scientist in a related discipline) who had demonstrated knowledge of the electoral process in a particular country (such as through publications, membership of a relevant research group or network, or university employment). The survey included 43% international experts and 57% domestic experts, the latter defined by location or citizenship. In total, 3,861 completed responses were received in the survey, representing a response rate of 28%. In certain cases, listed in Table A2, highlighted with an *, the number of responses was very low, with large confidence intervals, and these results should be treated with due caution.

Concepts: The idea of electoral integrity is defined by the project to refer to agreed international conventions and global norms, applying universally to all countries worldwide through the election cycle, including during the pre-election period, the campaign, on polling day, and its aftermath. ³⁸

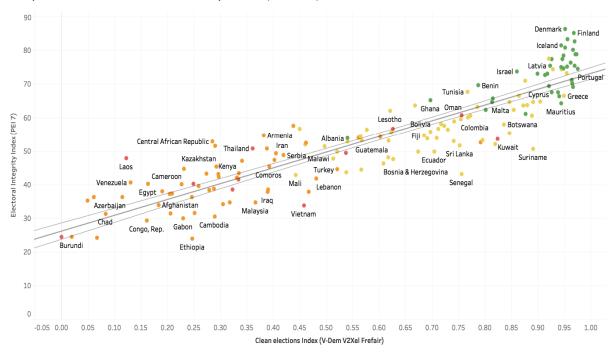

Measurement: To measure this concept, the PEI survey questionnaire includes 49 items on electoral integrity (see Table A3) ranging over the whole electoral cycle. These items fell into eleven sequential sub-dimensions, as shown. Most attention in detecting fraud focuses upon the final stages of the voting process, such as the role of observers in preventing ballot-stuffing, vote-rigging and manipulated results. Drawing upon the notion of a 'menu of manipulation', however, the concept of an electoral cycle suggests that failure in even one step in the sequence, or one link in the chain, can undermine electoral integrity. ³⁹ The PEI Codebook provides

detailed description of all variables and imputation procedures. A copy and all the data can down-loaded from https://thedata.harvard.edu/dataverse/PEI.

The electoral integrity items in the survey were recoded so that a higher score consistently represents a more positive evaluation. Missing data was estimated based on multiple imputation by chained equations in groups composing of the eleven sub-dimensions. The Perceptions of Electoral Integrity (PEI) Index is an additive function of the 49 imputed variables, standardized to 100-points. Sub-indices of the eleven sub-dimensions in the electoral cycle are summations of the imputed individual variables.⁴⁰

Validity and reliability tests: The results of the pilot study, from the elections held in 2012, were tested for external validity (with independent sources of evidence), internal validity (consistency within the group of experts), and legitimacy (how far the results can be regarded as authoritative by stakeholders). The analysis demonstrated substantial external validity when the PEI data is compared with many other expert datasets, as well as internal validity across the experts within the survey, and legitimacy as measured by levels of congruence between mass and expert opinions within each country.⁴¹

For *external* validity tests, when matched by country and year, the PEI Index of electoral integrity in this report was significantly correlated with other standard independent indicators contained in the 2019 version of the Varieties of Democracy dataset. This includes the Varieties of Democracy Indexes of Clean Elections (.903***), Electoral Democracy (polyarchy) (r=.851***, N. 159) and Liberal Democracy (r=.893***, N. 159), as well as the Polity IV revised combined Democracy scores (.699***).

Note: States are classified by Regimes of the World: Red =Closed Autocracy; Orange =Electoral Autocracy; Yellow= Electoral Democracy; Green =Liberal Democracy.

Sources: Varieties of Democracy (V-Dem-9); PEI-7.

For *internal* validity purposes, OLS regression models were run to test whether the PEI index varied significantly by several socio-demographic, political and experiential characteristics of the experts, including their sex, age, education, their level of expertise, and their self-reported ideological position. The sample was broken down by type of regime in the country (using the Regimes of the World classification), since a higher proportion of international experts were surveyed in electoral autocracies, where fewer political scientists study elections.

The results indicate that the use of domestic or international experts proved significant across all types of regimes, suggesting the importance of drawing upon both sources. Political views across the left-right ideological spectrum are significant and positive across all regimes, with experts located on the right more likely to give favorable assessments. Finally, in democratic states, sex, education, and familiarity with elections also played a role. The relatively modest adjusted R² suggested that the models explained a limited amount of variance in overall scores.

TABLE A2: SCORES, CONFIDENCE INTERVALS AND RESPONSE RATES

Country	PEI index of	PEI Index	PEI Index	PEI expert	Number of
	electoral	(raw	(raw	response	PEI expert
	integrity, (0-	individual),	individual),	rate	responses
	100),	low ci	high ci

V: ACKNOWLEDGMENTS

The dataset and report have been produced by the Electoral Integrity Project (EIP), based at Sydney and Harvard Universities. The research would not have been possible without the contribution of all the thousands of experts who kindly spent time and effort in responding to our requests for information. The EIP has been generously supported by the award of the Kathleen Fitzpatrick Australian Laureate from the Australian Research Council (ARC ref: FL110100093). The editors are most grateful for contributions from the EIP team, including Thomas Powell, Elias Christofi, and Laura Welty, as well as input from Ferran Martinez I Coma and visiting fellows. The full report is available for download from www.electoralintegrityproject.com and the dataset and codebook is available to be downloaded from https://thedata.harvard.edu/dvn/dv/PEI.
