Washington Organic Recycling Council
Soils for Salmon – Committee Charter

Objective: Transform building and site development practices around Washington, and around the U.S., toward protecting existing soil and vegetation where possible, and restoring construction-disturbed soils with compost amendments. Also promote compost-based erosion control practices, environmentally sensitive landscape development practices, and the successful evolution of stormwater practices that use compost and other organic materials.

Responsibilities:

- Train building, landscape, and development professionals in the soil best practices.
- Work with Ecology and the stormwater professional community to advance specifications and practices that address concerns and improve the use of appropriate compost products for stormwater management and landscape success.
- Spread the word about the benefits of compost for managing stormwater quantity and quality.
