Prevention efforts are our first line of defense when it comes to stopping the spread of invasive species, though even the best prevention efforts cannot stop the spread of all invasives. That is why Early Detection and Rapid Response (EDRR) is crucial. As our secondary defense, EDRR helps us to find localized infestations before they become well-established and widespread.

Join us this season to better connect with nature and the work CISMA does to preserve it. The Lake St. Clair CISMA hosts Workshops, where volunteers remove, detect, and inventory invasive plant species. Each workshop includes an educational component like plant identification and impacts, vegetation mapping, guided nature walks, and more.

Together we can reduce the impacts of invasive species, learn more about our natural communities, and enjoy a rewarding outdoor experience! Please register for workshops by emailing your local CISMA coordinator, McKenzi Bergmoser, with volunteer name(s) and workshop of interest.
