The euro area economy: an update

Euro Challenge – November 2016
What this presentation will cover

• A. Update on the economic situation in the euro area (GDP, Inflation, Unemployment)
• B. A supportive "policy mix"
• C. Risks
What this presentation will cover

• A. Update on the economic situation in the euro area (GDP, Inflation, Unemployment)
GDP growth: a key economic indicator

- **Gross Domestic Product (GDP)** is the total value of all the goods (e.g. cars, iPods) and services (e.g. haircuts, insurance policies) produced by an economy.

- **GDP growth** tells you by how much GDP has increased compared to the last year (or last quarter).

  - GDP growth is expressed as a percentage.

  - When the economy is growing, GDP growth is a **positive number**.

  - In a recession, GDP growth is **negative** (GDP shrinks).
GDP is growing

EU and U.S. real GDP growth, in %

Source: European Commission, Autumn forecast, Nov. 2016
Growth outlook is improving

EA: 1.7% in 2016, 1.5% in 2017 and 1.7% in 2018

However, the legacy of years of crisis persist and the labour market can still improve.

Private consumption slowing down but still driving growth

Private consumption has been the key factor in the recovery's recent strength and it will continue over the coming 2 years:

- Job gains and wage increases are boosting nominal income.
- Low inflation is increasing purchasing power.
- However, as energy prices rebound, the pace of growth in consumption may slow.

Improving investment conditions

Investment is set to accelerate in 2018:

- Encouraging outlook.
- Financing conditions have improved and will continue to do so.
- Capacity utilization above LTA
- External demand expected to gradually strengthen

Source: European Commission
Growth is forecast in all EU countries in 2017

Good news:
- All EU MS set to grow in 2017.
- Stronger than expected employment growth
- Investment is finally growing
- Inflation is expected to pick up
- Public finances are improving gradually

Inflation

• Inflation is the general increase in the level of certain measured prices over a certain period. It is expressed as a percentage change.

• A little inflation is fine, even desirable, but too much of it can be damaging, both to people’s livelihoods and to the economy as a whole.

• High inflation usually occurs when an economy is over-heating (growing too quickly). When growth is too weak, there may be a risk of deflation (falling prices) – which sounds great but can be very bad!
Inflation has been low but is expected to pick up more.

Low inflation has been caused primarily by declining energy prices.

But the impact should prove transitory and euro area inflation is expected to begin rising as the economy improves and the unemployment rate falls further.

Source: European Commission, Autumn Forecast, 2016
Inflation is picking up

- Inflation in the euro area was very low in the first half of 2016.

- Declining energy prices have been keeping inflation, but inflation started to pick up in the third quarter of 2016, as the transitory effects of these factors wear off and the economic recovery gathers pace.

- Euro area inflation is expected to rise from 0.3% in 2016 to 1.4% in 2017 and 2018.

- Still, inflation is forecast to remain below the ECB's target (below, but close to 2% over the medium term). Monetary policy will likely remain accommodative for as long as needed to secure a sustained adjustment in the path of inflation.
The definition of unemployment is the number of people that are actively looking for work and have not found it in a certain period.

The unemployment rate is the share of the working-age population that is looking for work but not employed.

Unemployment normally rises in times of slow or declining GDP growth, and tends to fall in times of stronger GDP growth.

As economic activity increases, firms hire more workers to produce the goods and services people are consuming.
Unemployment is declining

Improved labour market conditions

Employment growth and unemployment rate, EU

- Employment has continued to grow since mid-2013. Employment is expected to grow faster this year than at any time since 2008 – and remain solid in 2017-18.

- The unemployment rate in the EU has declined from 11% in 2013 to around 8 ½ % this year. The unemployment rate, while remaining high, is set to come down to 9.2% in the EA in 2018.

- There are large disparities between countries’ unemployment rates, which ranged from below 3.8% to above 23% in October 2016.

What this presentation will cover

• B. A supportive policy mix
High debt and deficits

• The *deficit* is the difference between the amount of money a government takes in (revenue) and what it spends (outlays) *in a given year*. If that number is positive, there is a *surplus*.

The *debt* is the total amount of money the government owes. It is usually expressed as a percentage of GDP.

A debt level that is too high can lead to higher borrowing costs and slower economic growth. And slower GDP growth makes it more difficult to reduce deficits and debt!
The fiscal stance in the Euro Area is supportive

- After substantial adjustment in the past few years, fiscal policy is no longer a drag on growth since 2015.
- General government deficits are being reduced. Deficit to GDP ratios are forecast to fall to 1.5% in EA in 2017-18.
- Debt to GDP ratios have peaked and is expected to fall from 91.6% in 2016 to 89.4% in 2018.

What is monetary policy?

The euro area's monetary policy is run by the ECB

- Monetary policy is the process by which a central bank controls the supply of money for the purpose of steering economic growth and limiting inflation.

- By setting interest rates, central banks can influence borrowing and lending decisions by households and firms. Lower interest rates generally spur economic activity, while higher interest rates slow inflation down.

- Monetary policy can be described as neutral, expansionary ("loose/easy"), or contractionary ("tight"). The ECB targets an inflation rate of close to, but below, 2%, and adjusts monetary policy to meet that target.
Monetary policy is accommodative

- Interest rates have come down and the ECB has provided additional measures of quantitative and credit easing
- These measures have eased financial fragmentation and improved access to credit
- Sovereign bond yields have continued to decline
- The positive impact on confidence and credit should continue, which will support investment and consumption.

What this presentation will cover

• C. Risks
The recent tailwinds are fading

Oil price decline (since 2014) has run its course
Euro depreciation since 2014 had supported European exports – recent appreciation
Global GDP growth has been slowing

Brent oil spot price assumptions

Source: ICE

Source: European Commission
External trade remains weak

The current weakness of global trade outside the EU is weighing on exports.

Intra-European trade has been resilient.

Looking ahead to 2018, we expect positive growth impulses from external trade.

Source: European Commission
Risks to the growth outlook

(-) Brexit-related uncertainty
(-) Political and policy uncertainty
(-) China's economic adjustment and slower growth in non-EU advanced economies
(-) Geopolitical tensions and security threats
(-) Capacity of the banking sector to support investment recovery
