OVERHAUL OF BODYSIDE DOOR
LOCKS AND STRIKING PLATES

May 1984

Issued by:–
D. of M. & E.E. B.R.B.
Railway Technical Centre,
DERBY.
OVERHAUL OF BODYSIDE DOOR
LOCKS AND STRIKING PLATES

CONTENTS:

1. INTRODUCTION
2. GENERAL NOTES
3. INDEX TO ENGINEERING INSTRUCTIONS
4. GLOSSARY OF TERMS
5. CLEANING AND TREATMENT
6. LOCK TYPES
   6.1 SINGLE ACTION LOCK
       Details of overhaul and end bench testing
   6.2 DOUBLE ACTION LOCK WITH OUTSIDE ACTUATION
       Details of overhaul and end bench testing
   6.3 DOUBLE ACTION LOCK WITH OUTSIDE AND INSIDE ACTUATION
       Details of overhaul and end bench testing
7. STRIKING PLATE TYPES
8. HANDLE AND ROSE PLATE
9. TEST EQUIPMENT
10. TESTS AFTER FITTING TO VEHICLE
11. APPENDICES
   11.1 Lock tongue/safety catch engagement
   11.2 Profile of striking plate setting template
   11.3 How to use in-situ door lock test device
   11.4 How to use inside actuation door lock test device
   11.5 Drawings of all locks for easy in-situ identification
1. INTRODUCTION

1.1 This document details the procedure to be followed in the overhaul and testing of bodyside door locks and striking plates when removed from vehicles undergoing main work repair.

1.2 Door lock "in-situ" test for both Main Works and Outstation Depots.

1.3 Also contained in this document are lists of parts and catalogue numbers of lock components as specified on the lock drawing arrangement, and where appropriate, catalogue numbers of identical components.
3. INDEX TO ENGINEERING INSTRUCTIONS

4. GLOSSARY OF TERMS

<table>
<thead>
<tr>
<th>Term</th>
<th>Action required</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHANGE</td>
<td>Remove the original and fit a new or overhauled part or assembly in its place.</td>
</tr>
<tr>
<td>CHECK</td>
<td>Determine a particular nominated condition before, during or after repair, e.g. completeness, security, position.</td>
</tr>
<tr>
<td>CLEAN</td>
<td>Take off all dirt and deposits.</td>
</tr>
<tr>
<td>DISMANTLE</td>
<td>Take to pieces.</td>
</tr>
<tr>
<td>EXAMINE</td>
<td>Determine general condition before repair, e.g. wear, cracks, splits, leaks, scoring, corrosion, breaks, distortion, looseness.</td>
</tr>
<tr>
<td>INSPECT</td>
<td>Determine general condition after repair and attention, i.e. conformity to required standards.</td>
</tr>
<tr>
<td>OVERHAUL</td>
<td>Do what is necessary to make assembly or sub-assembly re-usable, i.e. dismantle, strip clean, examine fit new parts, repair, re-assemble, test and inspect as required.</td>
</tr>
<tr>
<td>REASSEMBLE</td>
<td>Put together.</td>
</tr>
<tr>
<td>RECORD</td>
<td>Put down in writing a finding from examination, test, inspection or special checks.</td>
</tr>
<tr>
<td>RECTIFY</td>
<td>To set right.</td>
</tr>
<tr>
<td>REFIT</td>
<td>Put back and reconnect.</td>
</tr>
<tr>
<td>REMOVE</td>
<td>Disconnect and take off.</td>
</tr>
<tr>
<td>RENEW</td>
<td>Remove and scrap the original part and put new part in its place.</td>
</tr>
<tr>
<td>REPAIR</td>
<td>Restore an original part to the required condition by hand-tooling, machining, building-up, welding, patching, bending, setting, heat-treating, re-securing, etc.</td>
</tr>
<tr>
<td>STRIP</td>
<td>Take off covering, i.e. paint, polish, fabric, etc.</td>
</tr>
<tr>
<td>TEST</td>
<td>Prove correct operation by trial.</td>
</tr>
</tbody>
</table>

(Related to Engineering Instruction G/82)
5. CLEANING AND TREATMENT

5.1 Locks, handles and striking plates must be cleaned by immersing in approved cleaning agent until accumulations of dirt, oil and grease have been removed.

5.2 Plated components which are worn, damaged or have received heat treatment during repair, welding for example, must be stripped of the existing coating and replated to the original standards.
6. LOCK TYPES

6.1 Single Action lock

Drawing references:

BL-AO-9016664 - Inside and outside actuation.

SC/ES/893 - Outside actuation.

C-AL-335 - Outside actuation.

Dismantle and give attention to components as follows:

6.1.1 Case

If bolt guide surfaces are worn 0.4 mm (\(\frac{1}{64}\)"") or if bolt aperture has worn by this amount in either direction, renew lock.

If pinion housing has worn 0.4 mm (\(\frac{1}{64}\)"") or more on original diameter, renew lock. Tapped holes to be filled by brazing and drilled and re-tapped where the threads are worn. Where the surface chrome is damaged repair by re-chroming.

6.1.2 Bolt

(a) Renew bolt if any visual signs of wear exist on the tip profile.

(b) Renew bolt if the length is less than:

<table>
<thead>
<tr>
<th>Bolt Number</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>BL-AO-9016664/5</td>
<td>94 mm  (3(\frac{11}{16})&quot;&quot;)</td>
</tr>
<tr>
<td>BL-AO-9016664/8</td>
<td>94 mm  (3(\frac{11}{16})&quot;&quot;)</td>
</tr>
<tr>
<td>C-AL-335-5</td>
<td>98 mm  (3(\frac{7}{8})&quot;&quot;)</td>
</tr>
<tr>
<td>C-AL-335-6</td>
<td>98 mm  (3(\frac{7}{8})&quot;&quot;)</td>
</tr>
</tbody>
</table>

(c) Renew bolt if teeth are visually worn or damaged

(d) Renew bolt if any visual sign of wear exists on the sides.

6.1.3 Pinion

Fit new pinion.

Cont'd...
6.1.4  **Bolt Spring**

Renew Spring.

6.1.5  **Spring guide pin**

Examine and renew if corroded, distorted or worn.

6.1.6  **Re-assembly**

Re-assemble lock and lightly lubricate all items inside the lock with grease B.R. Cat. 27/1350.

6.1.7  **Repair Identification**

On completion of the re-assembly but before the bench test the repair date and repair centre code is to be stamped into the lock case adjacent to where the bolt projects. Repair centre codes are, Derby 'D'; York 'Y'; Swindon 'S'; Eastleigh 'E'; Wolverton 'W'; Glasgow 'G'.

6.1.8.  **Bench test**

Check that the lock mechanism operates freely and that the tongue projection is not greater than:

- B1-A0-9016664 16.3 mm \( \left( \frac{41}{64}\text{"} \right) \)
- SC/ES/893 16.3 mm \( \left( \frac{41}{64}\text{"} \right) \)
- C-Al-335 22.2 mm \( \left( \frac{7}{8}\text{"} \right) \)

**NOTE:** Adjustment is only permitted to the pinion shoulder if the door handle is not horizontal and/or the bolt projection is incorrect.

Test the lock bolt spring's force, to be checked against the figures given below using the bench test equipment detailed in Section 9.

(a) **Minimum load to commence actuation**

4.9 kgf. (10\( \frac{3}{4} \) lbf)

(b) **Minimum load to complete actuation**

5.9 kgf. (13 lbf)

(c) **Maximum load to complete actuation**

6.75 kgf. (15 lbf)

Check that the loading and unloading pressures increase and decrease uniformly throughout the bolt travel.

See Section 9 for test equipment details. When the above checks have been carried out satisfactorily the casing screws must be locked in position by peening and/or the use of the Loctite 270 B.R. Cat. 7/60352.
## Door Lock Arrangement B1-AO-9016664/1 - As Drawn

</tr>
</tbody>
</table>
6.2.4 **Bolt Spring**
Renew Spring.

6.2.5 **Spring guide pin**
Examine and renew if corroded, distorted or worn.

6.2.6 **Re-assembly**
Re-assemble lock and lightly lubricate all items in side the lock with grease B.R. Cat. 27/1350.

6.2.7 **Repair Identification**
See para. 6.1.7.

6.2.8 **Bench test**
Ensure that the lock mechanism operates freely and that the tongue projection is not greater than:

<table>
<thead>
<tr>
<th>Part No</th>
<th>Projection尺寸</th>
</tr>
</thead>
<tbody>
<tr>
<td>SC/DE/21626</td>
<td>22.2 mm (7/8&quot;)</td>
</tr>
<tr>
<td>Bl-Al-9015382</td>
<td>22.2 mm (7/8&quot;)</td>
</tr>
<tr>
<td>C-Al-1469</td>
<td>22.2 mm (7/8&quot;)</td>
</tr>
<tr>
<td>Bl-AO-9002399</td>
<td>22.2 mm (7/8&quot;)</td>
</tr>
</tbody>
</table>

**NOTE:** To ensure that the above requirements are maintained with the handle in the horizontal position adjustment is only permitted at the pinion shoulder.

Check the ram projection and renew if less than 6.3 mm (1/4").

Test the lock bolt spring/s force, to be checked against the figures given below using the bench test equipment detailed in Section 9.

(a) For SC/DE/21626, Bl-AO-9015382 and C-Al-1469

- Minimum load to commence actuation 6.75 kgf. (15 lbf)
- Maximum load to complete actuation to prop engagement 13.5 kgf. (30 lbf)

(b) For Bl-AO-902399

- Minimum load to commence actuation 14.5 kgf. (321bf)
- Maximum load to complete actuation to prop engagement 22.23 kgf. (491bf)

Ensure that the pressure decreases uniformly when the bolt is released. See Section 9 for test equipment details. When the above checks have been carried out satisfactorily the casing screws must be locked in position by peening and/or the use of Loctite 270 B.R. Cat. 7/60352.

6.3 **Double action lock with outside and inside actuation**

Drawing references:

BL-S-9016517
SC/DE/21626-2

Dismantle and give attention to components as follows:

6.3.1 **Case**

If bolt guide surfaces are worn 0.4 mm (1/64") or if bolt aperture has worn by this amount in either direction, renew lock.

If pinion housing has worn 0.4 mm (1/64") or more on original diameter, renew lock. Tapped holes to be filled by brazing and re-tapped when threads are worn. Where the surface chrome is damaged repair by re-chroming.

6.3.2 **Bolt**

(a) Renew bolt if any visual signs of wear exist on the tip profile.

(b) Renew bolt if length is less than:

BL-S-9016517 - 98.5 mm (37/8")
SC/DE/21626 - 115.5 mm (417/32")

(c) Renew bolt if teeth are visually worn or damaged (chipped)

(d) Renew bolt if any visual signs of wear exist on the sides.

6.3.3 **Pinion**

Fit new pinion.

6.3.4 **Bolt Spring**

Renew Spring.

6.3.5 **Spring guide pin**

Examine and renew if damaged, corroded, distorted or worn.
6.3.6 Ram and prop

Examine ram face and renew if worn by more than 1.5 mm ($\frac{1}{16}$") from the nominal sizes given on Bl-S-9016517 items 4 & 5.

If the wear on the prop is such that the bolt, in the engaged position, extends beyond 8 mm ($\frac{5}{16}$") then the prop must be renewed.

6.3.7 Inside actuation handle slide

Check condition of handle and locating pins and renew if defective.

6.3.8 Inside actuation handle shield

Repair and re-chrome where surface is damaged.

6.3.9 Re-assemble

Re-assemble lock and lightly lubricate all items inside the lock with grease B.R. cat. 27/1350. The four shield screws to be locked in position by the use of Loctite 270 B.R. Cat. No. 7/60352. The screws must not protrude into the lock interior.

6.3.10 Repair Identification

See para. 6.1.7.

6.3.11 Bench Test

Check that the lock mechanism operates freely and that the bolt projection is not greater than:

- SC/DE/21626 22.2 mm ($\frac{7}{8}$")
- Bl-S-9016517 22.2 mm ($\frac{7}{8}$")

NOTE: Adjustment is only permitted to the pinion shoulder if the door handle is not horizontal and/or the bolt projection is incorrect.

Check ram projection and renew if less than 6.3 mm (0.25"). Test the lock spring/s force, to be checked against the figures given below using the bench test equipment detailed in Section 9.

(a) Minimum load to commence actuation 5.45 kgf (12 lbf)

(b) Maximum load to complete actuation 6.82 kgf (15 lbf)

Check that the pressure decreases uniformly when the bolt is released. See section 9, for test equipment details.

When the above checks have been carried out satisfactorily the casing screws must be locked in position by peening and/or the use of Loctite 270 B.R. Cat. 7/60352.
6.3 Double action lock with outside and inside actuation

Drawing references:

Bl-S-9016517
SC/DE/21626-2

Dismantle and give attention to components as follows:

6.3.1 Case

If bolt guide surfaces are worn 0.4 mm (1/64") or if bolt aperture has worn by this amount in either direction, renew lock.

If pinion housing has worn 0.4 mm (1/64") or more on original diameter, renew lock. Tapped holes to be filled by brazing and re-tapped when threads are worn. Where the surface chrome is damaged repair by re-chroming.

6.3.2 Bolt

(a) Renew bolt if any visual signs of wear exist on the tip profile

(b) Renew bolt if length is less than:

Bl-S-9016517 - 98.5 mm (3 7/8")
SC/DE/21626 - 115.5 mm (4 17/32")

(c) Renew bolt if teeth are visually worn or damaged (chipped)

(d) Renew bolt if any visual signs of wear exist on the sides

6.3.3 Pinion

Pit new pinion.

6.3.4 Bolt Spring

Renew Spring.

6.3.5 Spring guide pin

Examine and renew if damaged, corroded, distorted or worn.

7. STRIKING PLATE TYPES

7.1 Drawing references C-Al-6643 and C-Al-13754 only (For drawing references Bl-AO-9015447 and Bl-S-9016517 see section 7.2).

Dismantle and give attention to components as follows: (see also E.1. HC/153).

7.1.1 Cam Housing

Examine lugs and repair or renew striking plate if defective.

Check that the cam 45° angled face is undamaged.

7.1.2 Lock Bolt Well

Examine internally for evidence of ridging. All ridges and grooves must be dressed out. Maximum enlargement of well not to exceed 1 mm (0.040") on drawing dimensions.

7.1.3 Striking Plate Face

Examine for wear and restore profile were necessary by welding and dressing off to a smooth finish.

7.1.4 Cam

Examine pivot pin holes and renew if worn above 7 mm (9/32") diameter. Restore were necessary or renew if excessively worn.

7.1.5 Pivot Pin

Renew.

7.1.6 Spring

Renew.

7.1.7 Draught Excluder

Renew.

7.1.8 Re-assembly

Re-assemble striking plate and check as follows:

Lightly smear cam and spring with grease BR Cat. No. 27/1350 and re-assemble.

Check that the cam operates freely and when released returns to the fully extended position.

Check that the projection of the cam from the striking plate face is not less than 18 mm. (3/32").
Check that the spring, pivot pin and retaining socket screws are secure.

When the above checks have been carried out satisfactorily the fixing screws must be locked in position by peening and the use of Loctite 270 BR Cat. No. 7/60352.

7.2 Drawing references Bl-A0-9015447 and Bl-S-9016517 only. (For drawing references C-Al-6643 and C-Al-13754 see section 7.1.)

Dismantle and give attention to components as follows:

7.2.1 Cam Housing

Repair or renew if:

(a) Lugs are defective or wall thickness has been reduced.

(b) Cam spigot bearings are worn to 7 mm (9/32") diameter.

(c) Tapped holes for cap plate are defective.

(d) Cam hole dimension exceeds drawing dimension by more than 0.8 mm (1/32").

7.2.2 Lock Bolt Well

Examine internally for evidence of ridging. All ridges and grooves must be dressed out. Maximum enlargement of well not to exceed 1 mm (0.040") on drawing dimensions.

7.2.3 Striking Plate Face

Examine for wear and restore profile were necessary by welding and dressing off to a smooth finish.

7.2.4 Back Plate (Cap Plate)

Check that the plate is flat and examine countersunk holes. Rectify any defects.

Check condition of cam spigot bearing and renew if worn.

7.2.5 Cam

Examine spigots and renew if worn to, or below 6 mm (15/64") diameter.

Examine catch face and shoulder stop and renew if defective.
7.2.6 **Spring**
Renew.

7.2.7 **Draught Excluder**
Renew if worn or defective.

7.2.8 **Re-assembly**
Re-assemble striking plate and check as follows:

Lightly smear cam and spring with grease BR. Cat. 27/1350 and re-assemble.

Check that the cam operates freely and when released returns to the fully extended position. Check that the projection of the cam from the striking plate face is not less than 5 mm (3/16\(^{\text{th}}\)). Check that the shoulder of the cam does not protrude beyond the face of the striking plate. When the above checks have been carried out satisfactory the fixing screws must be locked in position by peening and the use of Loctite 270 BR. Cat. No. 7/60352.

</table>
8. HANDLE AND ROSE PLATE

Check condition of handle and rose plate. Check that the handle is a good fit yet freely moves in the rose plate.

Examine threads on handle and rose plate and renew if damaged.

Check that spindle is not bent, twisted or worn. Renew if defective or repair by 'flash butt' welding. Welding must conform to the standards required in BR Specification 528.

Check that the square face of the spindle is in correct alignment with the handle.

For handles BR Cat. No. 63/464 see E.1. G/515.

For handle B.R. Cat. Nos. 18/9834 and 18/138 see E.1. G/539.
9. TEST EQUIPMENT

9.1 Where bench testing of the force being applied to the lock bolt is called for in this document, this must be carried out using a Lock Spring Force Test Rig obtainable from

Pickersgill-Kaye Ltd
10 Pepper Road
Leeds LS10 2EH

to their drawing number HP 30652 and used in conjunction with a Chatillon Dial push pull gauge DPP/25 kg obtainable from

Mecmesin Ltd
Newton Heath
Cross Road
Tadworth
Surrey KT20 5SR
Telephone Tadworth 4113 or 4114.

9.2 Where bench testing of the force required to operate the inside actuation slide of door locks with inside and outside actuation, then this must be carried out using a device for testing inside actuation door lock operating force, BR Drg No. TSU-A0-9018312.

9.3 Where in-situ testing of the force required to operate the bolt on door locks is required this should be carried out using the test device to BR Drg No. TVE-A0-0030 in conjunction with a Chatillon Dial push/pull gauge DPP/25 kg.
10. TESTS AFTER FITTING TO VEHICLES

10.1 Double Action Lock (wrap round corner door)

10.1.1 Check that the striking plate is located on the door pillar correctly.

(a) The striking plate shall be set at an angle of 10°30' from a horizontal line taken at 90° to the body skin, represented by the line A-B shown in the Section 11 Appendices 11.1.1 and 11.1.2.

(b) Referring to 11.1.1 and 11.1.2 the edge of the striking plate marked C shall be fitted flush with the corner of the corrosion moulding.

(c) The engagement between the lock bolt and striking plate safety catch shall not be less than 5 mm.

(d) Profiles of setting templates are shown in Section 11. Appendices 11.2.1 and 11.2.2.

10.1.2 Check the lock bolt slides freely into the fully engaged position in the striking plate and that the handle is horizontal when the lock bolt is fully engaged.

10.1.3 With the door in the open position check bolt extends no more than the following:

<table>
<thead>
<tr>
<th>Code</th>
<th>Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>SC/DE/21626</td>
<td></td>
</tr>
<tr>
<td>Bl-A1-9015382</td>
<td></td>
</tr>
<tr>
<td>C-A1-1469</td>
<td>22.2 mm (7/8&quot;)</td>
</tr>
<tr>
<td>Bl-A0-9002399</td>
<td></td>
</tr>
</tbody>
</table>

10.1.4 Doors must be opened and slammed shut from the half-open position and checked that the lock bolt is fully engaged and the handle correctly aligned. Maximum allowable misalignment is ± 5°.

10.1.5 With the door lock bolt in the safety catch position, check that the door is retained by the safety catch and that the minimum lock bolt to safety catch engagement is 5 mm.

If the engagement is found to be less than 5 mm and the lock bolt and striking plate projections are correct then adjustments must be carried out by shimming. Metallic shims only shall be used to Drawing No. C-A3-25166 items 1 and 2, BR Cat Nos. 63/8121 and 63/8122. The maximum amount of shimming is 4 mm.

Should the 5 mm engagement not be obtained by this means, thin shimming to a maximum of 3 mm of the lock must be carried out. Metallic shims only shall be used to Drawing No. A1-A2-8501114, BR Cat No. 850/111401.

Should the 5 mm engagement not be obtained this indicates a defective door lock striking plate mounting or door/door lock mounting which must be corrected before proceeding further.

Issue 3
April 1986
After correct engagement requirements, and correct interaction of door lock bolt to striking plate has been obtained, care must be taken that the correct working clearance of 1.5 mm to 2 mm is obtained between the door edge and striking plate.

10.1.6 Test the lock bolt spring/s force, using the in-situ test device stated in Section 9. This equipment should be used as follows:

(i) The device must be inserted into the striking plate and attached to the end of the bolt as shown in Section 11 Appendix 11.3.

(ii) The double action must be released before any readings are taken, by pulling by hand the in-situ test device until the bolt will move no more and at this point the ram must be pushed in, and the bolt then released, allowing it to fully extend.

(iii) Readings must be taken and multiplied by 3 to reach the following figures:

(a) For SC/DE/21626, Bl-Al-9015382 and C-Al-1469. Minimum load to commence actuation 6.75 Kg.f.

(b) For Bl-AO-9002399. Minimum load to commence actuation 14.5 Kg.f. Maximum load to complete actuation 22.23 Kg.f.

10.2 Double action locks (other than wrap round corner doors).

10.2.1 Check that the lock bolt slides freely into the fully engaged position in the striking plate and that the handle is horizontal when the lock bolt is fully engaged. Maximum allowable misalignment is +5°.

10.2.2 With the door in the open position check that the bolt extends no more than the following:

SC/DE/21626 )
Bl-S-901651277)
C-Al-1469 ) 22.2 mm (7/8")
Bl-AO-9002399)
Bl-Al-9015382)

10.2.3 Doors must be opened and slammed shut from the half open position and checked that the lock bolt is fully engaged and the handle correctly aligned.

10.2.4 With the door lock bolt in the safety catch position, check that the door is retained by the safety catch and that the double action ram and the door lock bolt is in contact with the striking plate.

10.2.5 Check that the double action ram engages lock bolt when the door is fully open and that there is no premature release of the ram.
10.2.6 Test the door lock inside actuation, by using the device for testing inside actuation door lock operation force. See Section 9 for test equipment and section 11 Appendix 11.4 for the use of the test equipment. The force required must not exceed 11.4 kgf. (25 lb.f.)

10.2.7 Test the lock bolt spring/s force, using the in-situ test device stated in Section 9. This equipment should be used as follows:-

(i) The device must be inserted into the striking plate and attached to the end of the bolt as seen in section 11 Appendix 11.3.

(ii) The double action must be released before any readings are taken, by pulling by hand the in-situ test device until the bolt will move no more, and at this point the ram must be pushed in, and the bolt released allowing it to fully extend.

(iii) Readings must be taken and multiplied by 3 to reach the following figures:-

(a) For SC/D /21626, Bl-AO-9015382 and C1-Al-1469
Minimum load to commence actuation 6.75 Kgf
Maximum load to complete actuation to prop engagement 13.5 Kgf.

(b) For Bl-AO-9002399
Minimum load to commence actuation 14.5 Kgf
Maximum load to complete actuation to prop engagement 22.23 Kgf.

10.3 Single action locks (excluding modified experimental locks).

10.3.1 Check that the lock bolt slides freely into the fully engaged position in the striking plate and that the handle is horizontal when the lock bolt is fully engaged. Maximum allowable misalignment is ±5°.

10.3.2 With the door in the open position check that the handle operates freely and when released the bolt returns to full projection. Check that sticking or binding does not occur.

Check that the bolt extends no more than the following:-

- Bl-AO-9016664 16.3 mm (41/64")
- SC/ES/893 16.3 mm (41/64")
- C-Al-335 22.2 mm (7/8")

10.3.3 Doors must be slammed shut from the half-open position and checked that the lock bolt is fully engaged and the handle is correctly aligned.

10.3.4 With the door lock bolt in the safety catch position, check that the door is retained by the safety catch and that the lock bolt is fully extended and the safety catch has no excess play.
10.3.5 Test the lock bolt spring/force, using the in-situ test device stated in Section 9. This equipment should be used as follows:-

(i) The device must be inserted into the striking plate and attached to the end of the bolt as seen in section 11 Appendix 11.3.

(ii) Readings must be taken and multiplied by 3 to reach the following figures:-

(a) Minimum load to commence actuation 4.9 Kg.f.

(b) Minimum load to complete actuation 5.9 Kg.f.

(c) Maximum load to complete actuation 6.75 Kg.f.

10.4 Single action lock (other than wrap around corner doors).

10.4.1 Check that the lock bolt slides freely into the fully engaged position in the striking plate and that the lock handle is horizontal when the lock bolt is fully engaged. Maximum allowable misalignment is $\pm 5^\circ$.

10.4.2 With the door in the open position check that handle operates freely and when released the bolt returns to full projection. Check that sticking or binding does not occur.

Check that the bolt extends no more than the following:-

BL-AO-9016664 16.3 mm (51/64")
SC/ES/893 16.3 mm (51/64")
C-AI-335 22.2 mm (7/8")

10.4.3 Doors must be slammed shut from the half-open position and checked that the lock bolt is fully engaged and the handle correctly aligned.

10.4.4 With the door held on the striking plate safety catch check that the lock bolt is in contact with the face of the striking plate and that, in this position, the handle gives a clear indication of misalignment from the horizontal position. If the misalignment from the horizontal is less than 10º adjustments must be made by using approved metal shims behind the striking plate in order to restore the handle misalignment to approx. 20º.
10.4.5 Test the door lock inside actuation by using a device for testing inside actuation door lock operating force, see Section 9 for test equipment and section 11 Appendix 11.4 for the use of the test equipment. The force required must not exceed 11.4 Kg.f. (25 lb.f).

10.4.6 Test the lock bolt spring/s force, using the in-situ test device stated in Section 9. The equipment should be used as follows:

(i) The device must be inserted into the striking plate and attached to the end of the bolt as shown in section 11 Appendix 11.3.

(ii) Readings must be taken and multiplied by 3 to reach the following figures:

(a) Minimum load to commence actuation
    4.9 Kg.f.

(b) Minimum load to complete actuation
    5.9 Kg.f.

(c) Maximum load to complete actuation
    6.75 Kg.f.
11. APPENDICES

11.1.1. Mk II D, E, & F, Mk III and H.S.T. passenger carrying rolling stock corner door lock bolt (safety catch engagement illustrations.)
11. APPENDICES

11.2.1 Profile of Striking Plate Setting template
11. APPENDICES

11.3 How to Use In-Situ Door Lock Test Device
11. APPENDICES

11.4 How to Use Inside Actuation Door Lock Test Device

The handle must be turned clockwise until the inside actuation starts operating. At this point a reading can be taken and if force exceeds 11.4 Kg.f. (25 lb.f.) the lock must be changed.
11. APPENDICES

11.4 How to Use Inside Actuation Door Lock Test Device

The handle must be turned clockwise until the inside actuation starts operating. At this point a reading can be taken and if force exceeds 11.4 Kg.f. (25 lb.f.) the lock must be changed.
11. APPENDICES

11.6 Drawings of All Locks for Easy In-Situ Identification

**Used on Mks I, II & IIa**
Drg. No. B1-A0-9015382

**Used on Mk IIb & IIc**
Drg. No. C-A1-335

**Used on Mk III**
Drg. No. B1-A0-9002399

DOOR LOCK CHANGING

B.R.M.L. Springburn have rejected a batch of door locks from the manufacturers, because the force required to operate the lock was below the minimum specified.

Until further notice please ensure that all vehicles, where the locks are changed, also receive the lock bolt spring force test specified in MT 261, Item 5.11 to ensure that they do not enter service with defective door locks.

Any locks which do not comply with the force required are to be replaced.

B. Scarrott.
Depot Engineer.
MEMORANDUM

To: Area Fleet Manager
Old Oak Common.
fao R.Pamment Esq.

From: Environment Engineer, Interiors Group.

Room: TX
Ext: 3546 or 6942

y/r:
o/r:TME-170-382-2(EGB) Date: 07/11/90

Subject: Door Lock Testing, MT/261.

With reference to the telephone conversation between Messrs Pamment/Bond on the above date. The vehicle should be tested to MT/261 report form clause 2.24. Testing to clauses 2.25 and 2.26 should not be carried out.

E.G. BOND
For
A.C. JONES
(Interiors Engineer).
