You’ve heard about meningitis.

Your child may have received a meningitis vaccine, but they are not fully vaccinated against meningococcal meningitis, a deadly bacterial infection, unless they’ve received two types of meningitis vaccines.

Don’t take a chance.
Ask your healthcare provider today if your child has received all the necessary doses of both the MenACWY and MenB vaccines.

Meningococcal meningitis can often occur without warning and can kill in as little as 24 hours.

Get informed.
