

## FREE FALL JUMP TOWERS

### EXPERIENCE NEW HEIGHTS

A Jump Tower is a tall structure built to allow for a “free fall” attraction. A free fall offers an exhilarating alternative to bungee jumping off the peak of a structure. A free fall jump can elevate pre-existing attractions such as Climbing Walls or Aerial Parks, and can even be installed in urban environments. This is a great activity for anyone and everyone who craves excitement and thrill. Most Jump Towers offer several different levels to jump from, allowing participants to truly push their limits and conquer their fears.

A Jump Tower is an exciting freestanding, high throughput activity with low staffing needs and a high ROI potential. All guests brave enough to climb to the top of a tall Jump Tower and step off the edge will love this adrenaline pumping attraction. At Tree-Mendous, we use systems either by HeadRush Technologies or PowerFan for all of our Jump Towers and free fall attractions. These systems allow for the thrilling sensation of a free fall with the added safety of our Edelrid harness and Smart Belay systems. Moments after you jump, the device activates its braking system which gently lowers you to the ground. However you decide to reach the top, this attraction will leave guests feeling invigorated by the rush, and owners satisfied with its huge appeal to a wide age range of participants.

A custom Tree-Mendous Jump Tower will give you an opportunity to offer a variety of free fall jump options and further expand your guest attendance. Installing different “drop” options and varying heights will increase throughput substantially.

The PowerFan is for the most extreme adventure seekers. This air break can handle heights up to 100’ with a maximum descent speed of almost 30 MPH. The FlightLine system allows guests to jump from 80’ up in the air and free fall for 36’ before the auto break kicks in. Head Rush’s patented magnetic eddy current braking technology is

extremely reliable and creates an amazingly soft catch. The dual braking system in FlightLine engages in two stages so the catch is smooth and gentle. The QUICKjump system has a free fall distance of either 6’, 9’ or 18’ which makes it a great option for adrenaline junkies, jumping from 60’ or higher! The TruBlue auto descender has a quicker break activation, providing a slower decent from jumps at about 30’.

Tree-Mendous will design an eco-friendly, organic and unique Jump Tower that compliments the aesthetics of your location. Landing areas will be surfaced with wood chips, as this provides an extra level of safety and keeps customers and the equipment clean.
