Cedar waxwings eat fruit, flowers, and insects. They are often found in suburban gardens and in flocks, as well as in hardwood and mixed forests. These birds are common to fairly common from spring through fall, and uncommon in winter in the Puget Sound area.
Serviceberry

A shrub-like tree that grows up to about 23 feet, Serviceberry blooms April-June and fruits from July-August. It can also be grown into a thicket or hedge, if desired.

Also known as Saskatoon, this plant is popular with birds that eat fruit, including nuthatches, sparrows, chickadees, warblers, waxwings, jays, grosbeaks, and woodpeckers. It also provides food and habitat for butterflies and caterpillars.

The fruits are used in pies, wine, and jam. Native Americans used the berries to help sweeten other foods and dried them into cakes for storage.

Serviceberry has an extensive range starting along the Pacific coast from California to Alaska, then eastward to Utah, Colorado, Iowa, and Minnesota, up to Ontario and Quebec, north through the plains and prairies into the Northwest Territories.
