The Islay Natural History Trust's

Checklist of the Butterflies and Dragonflies of Islay

Islay is a little too far west and north for some butterflies and dragonflies, but thanks to the variety of its habitats, the species totals are quite respectable. This list gives brief status details for the species which have been reliably recorded in the last 20 years or so, plus some other possibles. Our knowledge of several of them is incomplete and more records are needed. Please use the attached recording form to let us have your observations.

BUTTERFLIES

Dingy Skipper Erynnis tages

A 1960s record in north-west Islay is the only possible sighting.

Clouded Yellow Colias croceus

This migrant has reached Islay in major invasion years, e.g. 1947 and again more recently in 1992 and 2000.

Large White Pieris brassicae

Most records come from the Rinns and around Port Ellen and Port Askaig. Migrants arrive in some years.

Small White Pieris rapae

Not as common as the Large White but liable to turn up anywhere.

Green-veined White Pieris napi

Common and widespread, May to August.

Orange Tip Amthocharis cardamines

Recorded on two occasions during the 1970s, then not until the late 1990s, when there were two more records.

Green Hairstreak Callophrys rubi

Regular on the Rinns, sometimes in large numbers on the moorland; fewer reports from elsewhere.

Small Copper *Lycaena phlaeas*

Recorded from the Rinns and south-east Islay; status elsewhere uncertain.

Common Blue Polyommatus icarus

Widespread in lowland areas, especially on the limestone and dunes. The only 'Blue' on Islay.

Red Admiral Vanessa atlanta

Summer migrant in small numbers, usually appearing May, occasionally April, through to September.

Painted Lady Cynthia cardui

Summer migrant, less common that Red Admiral, with no records in some years.

Small Tortoiseshell Aglais urticae

Widespread and common.

Peacock Inarchis io

Once rare but now widespread; singles in 1985, 1992 and 1994, but since 1997 found over most of the island.

Dark Green Fritillary Argynnis aglaja

Locally common; identified by its strong, direct flight, rarely settling. The only large fritillary.

Marsh Fritillary Eurodryas aurinia

A nationally scarce species quite widespread on Islay, and locally common.

Scotch Argus Erebia aethiops

A single record from the south-east of the island in the mid-1980s.

Speckled Wood Pararge aegeria

Apparently confined to broad-leaved woodlands, e.g. Bridgend, Ballygrant and Kildalton.

Wall Brown Lasiommata megera

Two 1970s records, from the Rinns and from the Port Askaig area.

Grayling Hipparchia semele

Widely distributed in the south and west; status elsewhere uncertain.

Meadow Brown Maniola jurtina

Common and widespread.

Small Heath Coenonympha pamphilus

Common and widespread.

Large Heath Coenonympha tullia

Locally common on the Rinns and in a few places in the east.

Ringlet Aphantopus hyperantus

Recorded from much of the west and south of the island, as well as near Ballygrant; locally common.

In addition to the above, there are single pre-1975 records of **Silver-studded Blue** *Plebejus argus* and **Northern Brown Argus** *Aricia artaxerxes* from Port Ellen, but the former is now probably extinct in Scotland, while the latter occurs no nearer than Ayrshire. There is also a 1941 record of **High Brown Fritillary** *Argynnis adippe*, but its origins are considered doubtful.

Other species worth looking out for include: Large Skipper Ochlodes venata, Brimstone Gonepteryx thamni and Pearl-bordered Fritillary Bolinia euphrosyne, all of which have been recorded from Mull; and Small Pearl-bordered Bolinia selene, which is regularly recorded on Jura.

.....

DRAGONFLIES

Common Hawker Aeshna juncea

Mainly found on the Rinns and in woodlands at Ballygrant, Bridgend, and in the south and east.

Golden-ringed Dragonfly Cordulegaster boltonii

Widespread and quite common in open habitats as well as woodland.

Keeled Skimmer Orthetrum coerulescens

Two record from north-west Islay; in 1971 and 1992, the latter a mating pair.

Four-spot Chaser Libellula quadrimaculata

Recorded from the Rinns and from parts of the south and east.

Black Darter Sympetrum striolatum

Most records come from the Rinns, but probably occurs widely elsewhere.

Common Darter Sympetrum striolatum

Probably occurs quite widely, but difficult to separate from Highland Darter.

Highland Darter Sympetrum nigrescens

Widespread and locally common.

Beautiful Demoiselle Calopteryx virgo

Found in a few localities, mainly on burns running off the limestone.

Emerald Damselfly Lestes sponsa

Widespread and locally common; few records from the south-west or the north-east.

Large Red Damselfly Pyrrhosoma nymphula

Well destributed on the Rinns but few records from the south or east.

Blue-tailed Damselfly Ischnura elegans

Widespread and quite common.

Common Blue Damselfly Enallagma cyathigerum

Widespread and quite common, but perhaps less than than Blue-tailed Damselfly.

Found on Jura, but not so far on Islay, is the **Azure Damselfly** Coenagrion puella. Other species worth looking out for are the **Azure Hawker** Aeshna caerulea, the **Hairy Dragonfly** Bracytron pratense, the **Scarce Emerald Damselfly** Lestes dryas, the **Irish Damselfly** Coenagrion lunulatum and the **Variable Damselfly** C.pulchellum.
