**IPSec: Designing Information Security Dynamics for Future***

The majority of security solutions and services vendors in the Australian IT landscape are generalist IT, shared data centre or ISP entities that are substantially focused on domains data center, other than security. In a market where most organizations are in need of information security support, there needs to be a strategic subject matter expert business partner that can operate as a specialized extension of their IT function in all areas of Information Security. IPSec delivers on the strategic need with expertise to provide security advice and assistance making a real impact on security improvement initiatives. The company holds specialization in delivering end-to-end risk assessment and security standards based gap analysis, security testing, architectural design, provision of information security countermeasures, policy, 24 x 7 x 365 security monitoring, and management. James Pemberton, Director - Business Development, IPSec says, “Being a focused security specialist that can deliver expertise in all areas of Information Security, we offer a unique and strategic value to our client organizations that more generalist IT players cannot deliver.”

Today, IPSec provides information security guidance and outcomes to hundreds of organisations in all business sectors and including federal, state, and local governments and agencies. The company has pioneered significant investments in the latest countermeasure technologies by joining forces with world leading cyber security vendors. “Experience, and approaching security from a strategic business risk focus, matched with depth of security offering strategically and from a business risk viewpoint for a superior, structured, and measurable security outcome. This approach considerably bridges a widespread expectation and communication gap that broadly exists between executive business management and the IT function where information security is concerned. Pemberton further explains, “Taking a strategic risk assessment approach changes this and communicates actual business risks to demonstrate relevance, justification, and priority of projects in specifically addressing real and defined security weaknesses.” IPSec’s risk services assure the same by providing strategic view of business risks in all Information Security areas by aligning assessment of the organization with control objectives, including Cobit, NIST, CIS, ISO27001 or any other International Standard. Commenting on the modern information security scenario, Pemberton says, “There is a growing understanding among the informed IT world that breach is a reality that will befall most irrespective of all concerted efforts to defend against the ever increasing threat landscape.” In light of this, IPSec recently released its IPSec Guard cloud service. IPSec Guard, powered by LogRhythm is a 24 x 7 x 365 SIEM as a service; which does not require an onsite infrastructure on the client’s end. IPSec Guard holds the visibility of all security systems and applications within an organisation. It can correlate highly complex log data in real-time to detect when a breach has occurred to then initiate immediate contact with the organisation to mitigate the threat.

**IPSec is a specialist at providing strategic security assessment, and in architecting and delivering enterprise grade information security outcomes of security initiatives adopted by organisations has been applied in a tactical fashion; IPSec approaches actual business risks to demonstrate relevance, justification**
